Chapter 1 - General Summary 2004

Rates per 1,000 population

This report has been prepared by the Central Statistics Office for the Minister for Health and Children in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952 and Section 73 of the Civil Registration Act 2004.

The main statistics contained in this report have already been published, classified by year of registration, in the CSO Quarterly Vital Statistics reports. This annual report gives a further breakdown in respect of births and deaths that occurred in 2004. The year of occurrence data have been compiled from registration data for 2004 and 2005.

Information on marriages registered in 2004 is not included in the report but will be published separately at a later date.

This report includes statistics on stillbirths which became available following the introduction of a registration system under the Stillbirths Registration Act, 1994, and which replaced the series on late foetal deaths compiled up to 1994.

Births: The number of births which occurred during 2004 was 61,972: 31,966 males and 30,006 females. The birth rate was 15.3 per 1,000 population compared with 15.5 in 2003. The number of births outside marriage that occurred in 2004 was 19,798 or 32% of all births. For more details see Chapter 2.

Deaths: The number of deaths occurring during 2004 was 28,665: 14,801 males and 13,864 females. The death rate was 7.1 per 1,000 population. In 2003 deaths numbered 29,074 and the rate was 7.3. For more details see Chapter 3.

Of the deaths occurring in 2004, 27.3% were due to cancer; 25.9% were due to ischaemic and other forms of heart disease; 11.3% to other diseases of the circulatory system and 14.2% to diseases of the respiratory system.

Infant Mortality: During 2004 the number of deaths of infants under one year was 287 compared with 326 in 2003. The corresponding rate decreased from 5.3 to 4.6 per 1,000 live births. For more details see Chapter 4.

Stillbirths: The number of stillbirths occurring during 2004 was 321 compared with 345 in 2003. The corresponding rate dropped from 5.6 to 5.2 per 1,000 live and stillborn children. For more details see Chapter 4.

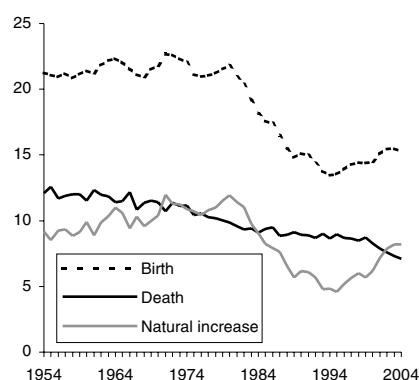

Population: The estimated population in April 2004 was 4,043,800: 2,011,200 males and 2,032,600 females.

Issue of Authority for Registration: Births and deaths (where no inquest has been held) which have not been registered within one year of their occurrence can be registered only on the authority of an t-Ard Chlaraitheoir (Registrar General). The tables in the main body of this report exclude such births and deaths. The Appendix to the report contains an analysis of late death registrations in 2004 and of some deaths where an inquest has been held. The number of such deaths registered in 2004 was 520.

More up to date information on Vital Statistics is published in the Quarterly Report on Births, Deaths and Marriages published about five months after the end of the quarter to which the data relate. In the Quarterly Report, births and deaths are classified according to quarter of registration.

Births are classified according to the area of residence of the mother and deaths according to the area of residence of the deceased. Births and deaths for each year since 1943 exclude late registrations; while deaths for each of the years 1940 to 1967 exclude non-residents. From 1968 however, the number of deaths includes non-residents.

Chapter 2 - Births 2004

The number of births which occurred in 2004 was 61,972 comprising 31,966 males and 30,006 females. The corresponding total for 2003 was 61,529, 31,455 males and 30,074 females. The birth rate in 2004 was 15.3 per 1,000 population, 0.2 below 2003.

Birth Order 2004

Birth Order 1955

Birth order

A total of 24,269 births (40%) were to first time mothers in 2004. Second time mothers had 19,867 (33%) and third time mothers had 10,503 (17%). On the other hand, only 10% of mothers already had three or more live born children (see table 2.8).

Classification by age at maternity, parity and duration of marriage

Table 2.8 shows the total number of births that occurred in 2004 classified by age of mother at maternity and number of previous liveborn children (i.e. parity). The mother's age was not stated in respect of 412 births (or 0.7% of the total). In 2003 the corresponding number was 340 (0.6%). In preparing this table the procedure in the case of multiple births was to count each child as an individual birth. For instance if a fifth pregnancy produced twins, the children would be classified as a fifth and sixth child in birth order.

In 1975 mothers under 30 years accounted for 61.7% of births. The proportion declined fairly steadily to reach 42.3% in 2003 and 40.8% in 2004. In England and Wales, and in Scotland in 2004, 51.1% and 50.4% respectively of mothers were aged under 30.

¹ First Births of First Marriage in Scotland.

Table 2.17 compares fertility rates in Ireland and England and Wales in 2004. In most age groups the number of births within marriage per 1,000 married women was considerably higher in Ireland than in England and Wales. The number of births outside marriage (i.e. per 1,000 single, widowed, divorced and separated women) was mostly lower in Ireland than in England and Wales.

The percentage distribution of births within marriage according to the number in previous children in 2003 and 2004 is shown in Table IV and a comparison made with the corresponding distributions in England and Wales and Scotland in 2004.

The percentage distribution of births according to previous number of children changed only slightly between 2003 and 2004, with the trend towards fewer previous children. The percentage of mothers with two or more previous children was higher in Ireland than in either England and Wales or Scotland. In Ireland in 2004, 1.5% of mothers had 5 or more previous children compared to 1.3% in England and Wales and 0.7% in Scotland.

¹ Includes stillbirths.

Births outside marriage

The total number of births outside marriage was 19,798 in 2004, i.e. 588 more than in 2003. This was equivalent to an annual rate of 32.6 per 1,000 unmarried females aged 15-49 years and was 31.9% of all births (see table 2.5).

The lowest ever number of births outside marriage was recorded in 1959. The graph illustrates the steady increase in the percentage of births outside marriage, notably since 1980.

The highest percentage of births outside marriage occurred in Limerick City at 53.5% while the county with the lowest percentage was Galway County at 21.1% (see table 2.19).

Total Period Fertility Rate

The total period fertility rate (TPFR) derived from the age-specific fertility rates. It gives the theoretical average number of children who would be born alive to a woman during her lifetime if she were to pass through her childbearing years conforming to the age-specific fertility rates of a given year. A value of 2.1 is generally taken to be the level at which a generation would replace itself in the long run, ignoring migration.

The TPFR has fallen by half in the past 30 years. In Ireland, it dropped below the replacement level in 1989 and has remained there since (see table 2.1). Despite the decline, we continue to have one of the highest fertility rates in Western Europe.

Multiple births

The number of maternities in 2004 which resulted in multiple live births was 996 consisting of 979 sets of twins, 16 sets of triplets and 1 set of quadruplets. This is equivalent to a "twinning rate" of 16.0 (ie the number of sets of live twins per 1,000 maternities which resulted in live births). Table 2.18 summarises the number of multiple births and the "twinning rate" for the years 1984 to 2004.

Domiciliary births

There were 295 babies born at home in 2004 (see table 2.15). This compares to 321 in 2003. Such births have dropped from one in three births in the early 1950's to only five in every thousand in 2004.

Live births

The terms used in relation to live births are defined as follows:

Parity: parity is the number of previous live born children to a woman.

Birth Order: Birth order is the number of live born children a woman has in the order in which they are born.

Parity and Birth Order: A first birth relates to parity 0 or birth order 1 i.e. birth order = parity + 1.

Crude birth rate (CBR): The number of live births divided by the total population at that age (or age group), multiplied by 1,000.

Age specific fertility rate (ASFR): The number of live births at a certain age (or age group) divided by the female population at that age (or age group) multiplied by 1,000.

Total period fertility rate (TPFR): The sum of the ASFRs, divided by 1,000, i.e. the expected number of children a woman will have in her lifetime based on the fertility of that year.

$$TPFR = \sum_{15}^{49} asfr / 1,000 \cong {}_5 TPFR = 5 \sum_{15-19}^{45-49} asfr / 1,000$$

Age specific reproduction rate (ASRR): The number of female live births at a certain age (or age group) divided by the female population at that age (or age group), multiplied by 1,000.

Gross reproduction rate (GRR): The sum of the ASRRs divided by 1,000 i.e. the expected number of daughters a woman will have in her lifetime based on the fertility of that year.

Net reproduction rate (NRR): The sum of the products of the ASRRs and the expected number of female years to be lived at that age, divided by 1,000 i.e. the GRR adjusted for female mortality.

The difference between the gross and net reproduction rates is an indicator of female mortality.

Average age at maternity: 0.5 plus the sum of the products of the ages at maternity of live births and their ages divided by the number of live births.

$$\text{average age} = 0.5 + \frac{\sum_{x=15}^{49} xf_x}{\sum_{x=15}^{49} f_x}$$

Average age at maternity of first birth: 0.5 plus the sum of the products of the ages at maternity of first live births and their ages divided by the number of first live births.

Childbearing years are regarded as between the ages of 15 and 49.

Live births to mothers aged less than 15 are included in the age 15 category and are divided by the age 15 population. Similarly live births to mothers aged greater than 49 are included in the age 49 category and are divided by the age 49 population.

Average of mean ages: Live births where the age at maternity is not stated are excluded from the calculation.

Calculation of Total Period Fertility Rate

The TPFR is compiled by summing the age specific fertility rates for the relevant five-year age groups, dividing by 1,000 and multiplying by 5. The small number of births for which the age of the mother is not stated is distributed in proportion to the stated categories.

Chapter 3 - Deaths 2004

There were 28,665 deaths in Ireland in 2004, of which 14,801 were males and 13,864 were females. This is equivalent to a rate of 7.1 deaths per 1,000 total population compared to 7.3 in 2003 and 7.6 in 2002.

Table 3.13 shows the annual average death rates, by age group, for decennial periods from 1864 to 2000 and the death rates for each year 1993 to 2004. While the crude death rate per 1,000 population has shown a gradual downward trend since the beginning of the century, striking long-term falls occurred in the death rates at the younger ages.

Table I compares the death rates in the years 1941-2004 with those in Northern Ireland, England and Wales and Scotland. The death rate in this country in 2004 was lower than in Northern Ireland, England and Wales and Scotland. Over the period covered in the table the decrease in this country has been greater than that in any of the other areas. These comparisons are based on crude death rates, which are to some extent affected by differences in the age-sex structures of the population in the different countries, while comparisons over a period of years are also affected by changes in the age-sex structures of the population.

Standardised death rates comparison between counties

Variations in the age distribution of the population from one county to another have an effect on the comparability of death rates between counties. If a particular county contains a large proportion of elderly persons the crude death rate per 1,000 population will be relatively high even if the health conditions in that county are better than the general average. In an attempt to overcome this standardised rates are prepared. For a particular county this is done by calculating the death rate in each age group of the population in that county and then multiplying the death rate in each age group by the population in the whole country in that age group and summing the resulting products. See table 3.4. Throughout the remainder of the report, only crude death rates will be reported.

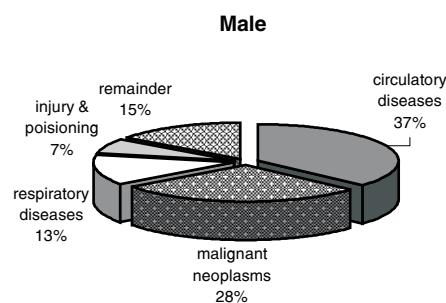

In certain areas the standardised death rates differ appreciably from the crude rates, the extremes being South Dublin which had a crude death rate of 4.15 and a standardised rate of 7.04 (reflecting the very young age structure in South

Dublin) and Leitrim where the standardisation had the effect of lowering the crude death rate from 10.70 to 7.50 because of the comparatively older age distribution in that county. The standardised rates in 2004 were lowest in Galway City (at 5.88 per thousand) and highest in North Tipperary (8.37 per thousand).

Causes of Death

The Ninth Revision of the International classification of Diseases, Injuries and Causes of Death (ICD-9), as recommended by the World Health Organisation, has been used to classify deaths in Ireland by cause since 1979. It replaced the Eight Revision (ICD-8) which was used from 1968 - 1978. To facilitate linkage with previous years all deaths in 1979 were, in addition, coded according to ICD-8. A cross-classification of deaths occurring in 1979 by the ICD-8 and ICD-9 classifications is contained in tables 60-63 of the 1979 Report. As ICD-9 imposed certain changes in interpretation of recorded medical opinion regarding the underlying cause of death when more than one disease is mentioned on the medical certificate of cause of death, care should be taken in comparing deaths coded according to ICD-9 with those prior to 1979.

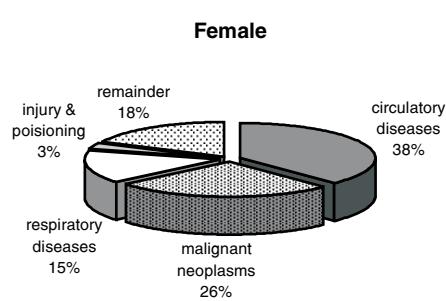

Injury and Poisoning: This category forms part of the main body of classification in ICD-9 and deaths coded accordingly are shown in table 3.19.

External Causes of Death: In the Sixth, Seventh and Eighth Revisions the E-code was considered as part of the main classification. In ICD-9 the E-code is treated as a supplementary classification to be used where relevant in conjunction with codes from any part of the main classification.

Of the deaths occurring in 2004, 74% were due to the four main causes, i.e. Ischaemic and other forms of heart disease, malignant neoplasms, cerebrovascular disease and respiratory diseases. Most of these deaths occurred at ages over 65 (see table 3.18).

Malignant neoplasms were responsible for the highest rates, 208 per 100,000 population for males and 179 per 100,000 females. Diseases of the heart were the next major cause, the rates for which were 197 and 162 for males and females respectively per 100,000 population. The rates for cerebrovascular disease were 42 and 62 respectively for males and females per 100,000 population. The rates for respiratory diseases were 98 per 100,000 male population and 104 per 100,000 female population. Table 3.19 contains more information on deaths classified by causes and age groups.

Some of the principal causes of deaths are considered in greater detail in the following sections.

Tuberculosis

In 2004 there were 40 deaths from tuberculosis, of which 18 were caused by the respiratory form and 22 by other forms of the disease see table 3.2. Deaths from tuberculosis are now only at a fraction of their level 50 years ago.

The mortality from tuberculosis in the counties and cities in 2004 is presented in table 3.24 of this Report.

Cancer

Table 3.5 shows the death rate from cancer in certain age groups in the years 1983 to 2004.

In 2004 the male death rate for all ages was 16% above that for females.

For comparability with the years prior to 1950 the total cancer figure less Hodgkin's disease and leukaemia should also be shown. In 2004 there were 7,828 deaths from cancer (Nos. 140 to 208). Of this number 13 deaths were caused by Hodgkin's disease and 293 by leukaemia and aleukaemia.

In the period under review the crude rates for England and Wales and Scotland were consistently higher than those for this country and Northern Ireland.

The death rates from cancer in 2004 in counties and cities are compared in Table 3.6. Standardised rates, which reduce the effect of different age distributions in the different areas, are also shown. The crude death rate from cancer in 2004 varied from 2.81 per 1,000 population in Cork City to 1.18 in Fingal. When comparing the relative seriousness of mortality in different counties it is, of course, the standardised rates which should be used. In the counties of the west and north-west, standardisation generally had the effect of lowering the death rates considerably. Again, throughout the remainder of this report, only crude death rates will be reported.

Full details of deaths due to cancer occurring in 2004, classified by disease and age group are contained in table 3.19. The death rates from cancer per 100,000 in each group for the main groups of sites are shown in table 3.3, which shows that there is, in general, a rapid rise in the death rate with increasing age.

The number of deaths and death rates from cancer of the larynx, bronchus, trachea and lung in each year 1983 to 2004, classified by sex and age group, are shown in table 3.7.

Diseases of the circulatory system

There were 10,666 deaths ascribed to diseases of the circulatory system (Nos.390-459) in 2004, of which 5,433 were deaths of males and 5,233 of females. Details of these deaths, classified by cause and age may be obtained from table 3.19 of this report while the numbers assigned to each county and city are shown in table 3.21.

The excess of male over female deaths is largely reflected in the number of deaths from ischaemic heart disease, 3,083 males, compared with 2,402 females, the majority of which were due to myocardial infarction (1,742 males compared with 1,379 females). See table 3.19. The converse is true for cerebrovascular disease (1,258 females compared with 848 males). In respect of the remaining groups of causes the difference between the male and female death rates is not nearly so pronounced.

Respiratory Diseases

Deaths from respiratory diseases (Nos. 460-519 in the International List) in 2004 numbered 4,079. These included 1,968 deaths from pneumonia, 76 from asthma, 5 from influenza and 2,030 due to other respiratory diseases.

Accidents, poisoning and violence

The number of deaths from external causes (numbers E800-E999) occurring in 2004 was 1,594 of which 1,127 were males and 467 were females. The corresponding figures for 2003 were 1,601 deaths – 1,108 male and 493 female. As has been mentioned deaths which have not been registered within one year of their occurrence have been excluded from the main body of this report. The exclusion of these cases may have a relatively more significant effect on the number of deaths classified to some external causes. See table 3.8.

As can be seen from table 3.9 there is an excess of male mortality from accidents which may be largely attributed to the category suicide and self-inflicted injury followed by road vehicle accidents. At ages over 75 years, the excess of female deaths may be attributed to accidental falls.

As can be seen from table 3.10, 310 deaths resulted from accidents in the home. This compares with 290 in 2003. Of the 310 deaths in 2004, 149 were accidental falls, and over half of these were in the 75 years and over category. Accidents caused by fire and flames accounted for 41 deaths, 2 of which were in the under 15 age group. There were 75 deaths from accidental poisoning.

Uncertified deaths

There were 25 cases in 2004 in which the cause of death was not certified by a medical practitioner, which represents 0.1% of the total deaths. This is much lower than the 8.5% in the period 1951-1960 and the 3.1% in the period 1961-1970.

Inquests and post-mortems

The number of deaths registered on certificates issued by coroners as a result of inquest and post-mortem examinations during 2004 was 4,684 compared with 4,427 in 2003.

Chapter 4 - Infant Mortality, Stillbirths and Maternal Mortality 2004

Infant and neonatal mortality rates per 1,000 live births

Infant mortality

During the year 2004 there were 287 deaths of infants under one year, compared to 326 in 2003. The infant mortality rate, which was 5.3 per 1,000 births in 2003, dropped to 4.6 in 2004.

Infant and neonatal mortality rates per 1,000 live births

Infant Mortality by detailed age

There were 209 neonatal deaths in 2004, a decrease of 24 on the 2003 figure. The neonatal mortality rate of 3.4 per 1,000 live births was 0.4 below the 2003 figure (see tables 4.1 and 4.2). Table II shows infant deaths by detailed age.

Infant Mortality by cause

The causes of deaths of infants under one year, classified according to the Detailed International List, are shown in table 3.19. In table 4.6 infant deaths are again classified by cause and a more detailed age classification shown.

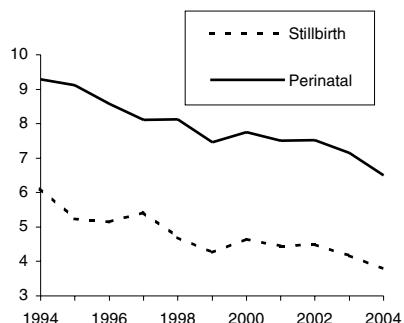

The relative importance of the various groups of causes differs appreciably between deaths of infants aged under one week and deaths at ages 4 weeks to 1 year. Of all deaths at ages under one week, 38% were due to congenital anomalies. The most common cause of death for infants aged 4 weeks to 1 year was sudden death (33%) followed by congenital anomalies (27%). See table 4.6.

Infant Mortality by area

Table 4.3 shows that the highest rate for infant mortality was in Limerick City and the lowest was in Laois. The rate for perinatal mortality was highest in Cavan and lowest in South Tipperary, in 2004. Further breakdowns by health board and regional authority are available in tables 4.8 to 4.11 by sex and age.

Stillbirth (28+ weeks) and perinatal mortality rates per 1,000 live and stillborn children

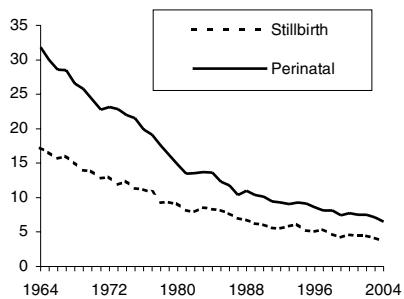

Stillbirths

While statistics of infant mortality are obtained in the course of the usual procedure for registration of deaths, which has been in operation since 1863, particulars of late foetal mortality have been obtained through a scheme of notification to the Directors of Community Care. The scheme of notifying late foetal deaths was introduced in 1957, but comparisons between different areas of the country showed marked differences in the coverage of the scheme in the early years. Consequently, the number of late foetal deaths in the early years of the scheme is believed to be understated.

In 1995 stillbirths were registered in Ireland for the first time under the Stillbirths Registration Act, 1994. The definition of a stillbirth under the Act is broader than the definition used for late foetal deaths in previous Vital Statistics Reports. This report contains tables in relation to 321 stillbirths which occurred in 2004. This compares with 345 stillbirths in 2003. Care should be taken in comparing statistics on stillbirths and late foetal deaths in consideration of the changes between the notification and registration systems.

For stillbirths the highest rate was in Laois and there were none in South Tipperary or Leitrim. (see table 4.3).

Deaths classified as being due to ill-defined conditions originating in the perinatal period accounted for 39% of the stillbirths. (see table 4.12).

Stillbirth (28+ weeks) and perinatal mortality rates per 1,000 live and stillborn children

Pregnancy, childbirth and puerperium

There was 1 maternal death in 2004, compared with none in 2003.

Table III compares Ireland and the neighbouring countries for the years 1990-2004.

Stillbirths and Infant Mortality

The terms used in relation to stillbirths and infant mortality are defined as follows:

Stillbirth: Stillbirth weighing 500 grams or more or at gestational age of 24 weeks or more. This definition applies to stillbirth figures from 1995 onwards.

Late foetal death: Foetal death at or over 28 weeks gestation. this definition was applied up to 1994 inclusive.

Early neonatal death: Death at ages under 1 week of live born infant.

Perinatal deaths: Stillbirths or late foetal deaths plus early neonatal deaths.

Late neonatal death: Death between the ages of 1 week and 4 weeks of live born infant.

Neonatal death: Death at ages under 4 weeks of live born infant.

Post neonatal death: Death between the ages of 4 weeks and 1 year of live born infant.

Infant death: Death at ages under 1 year of live born infant.

Stillbirth rate: Stillbirths divided by total live births plus stillbirths, multiplied by 1,000.

Late foetal mortality rate: late foetal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

Early neonatal mortality rate: Early neonatal deaths divided by total live births, multiplied by 1,000.

Perinatal mortality rate: perinatal deaths divided by total live births plus stillbirths, multiplied by 1,000.

Late neonatal mortality rate: Late neonatal deaths divided by total live births, multiplied by 1,000.

Neonatal mortality rate: Neonatal deaths divided by total live births, multiplied by 1,000.

Post neonatal mortality rate: Post neonatal deaths divided by total live births, multiplied by 1,000.

Infant mortality rate: Infant deaths divided by total live births, multiplied by 1,000.

⁴ Figures on stillbirths up to 1994 inclusive refer to the definition of late foetal deaths at or over 28 weeks gestation. From 1995 the figures relate to the new broader definition of stillbirths at or over 500g or at a gestational age of 24 weeks or more. For comparison purposes, figures according to the old definition are given in brackets from 1995 onwards.
