National Drug Treatment Reporting System 2014 – 2020 Drug Treatment Data

Cathy Kelleher, Anne Marie Carew and Suzi Lyons

Summary

In this bulletin, trends in **treated problem drug use** (excluding alcohol) are described for the seven-year period from 2014 to 2020. The data are drawn from the **National Drug Treatment Reporting System** (NDTRS), the national surveillance system that records and reports on cases of drug and alcohol treatment in Ireland.

NDTRS data for 2020 should be interpreted in the context of COVID-19. In 2020, there was an overall drop in the number of cases entering drug treatment which in part was the result of temporary service closures and measures introduced to comply with Covid-19 restrictions. This does not necessarily indicate a real decline in demand for treatment.

Overview

In the seven-year period, 68,571 cases were treated for problem drug use. The number of cases recorded decreased from 10,664 in 2019 to 9,702 in 2020, a drop of 9.0%

- The proportion of new cases was 38.2% in 2014 and 39.1% in 2020.
- In 2020, the majority of cases were treated in outpatient facilities (70.2%), as in previous years.
- Between 2019 and 2020, the number of cases treated in residential (inpatient) settings decreased by 24.3%.

Main problem drug (excluding alcohol)

- **Opioids** (mainly heroin) were the most common main problem drug in 2020. The proportion of cases treated for opioids decreased from 50.0% in 2014 to 36.7% in 2020.
- **Cocaine** was the second most common main problem drug reported in 2020. The proportion of cocaine cases increased from 8.6% in 2014 to 27.0% in 2020. Cocaine was the most common main drug among *new cases* in 2020. The proportion of new cases reporting cocaine as a main problem increased from 11.3% in 2014 to 35.8% in 2020.
- **Cannabis** was the third most common main problem drug reported in 2020. The proportion of cases treated decreased from 27.6% in 2014 to 21.9% in 2020. The proportion of new cases reporting cannabis as a main problem decreased from 44.9% in 2014 to 35.2% in 2020.
- **Benzodiazepines** were the main problem drug for 11.3% of cases in 2020, as compared to 9.6% of cases in 2014.

Polydrug use

- Over the period, the majority of cases reported **polydrug** use (58.0%).
- The proportion of cases with polydrug use decreased from 59.6% in 2014 to 53.4% in 2018, then increased to 58.6% in 2020.
- Cannabis (39.5%), cocaine (36.8%), benzodiazepines (36.5%), and alcohol (34.9%) were the most common **additional drugs** in 2020.

Risk behaviour

- The proportion of cases that had **ever injected** decreased from 35.7% in 2014 to 23.3% in 2020.
- In 2020, among cases who had injected, 37.8% had **shared needles and syringes**.

Socio-demographic characteristics

- The **median age** of cases increased from 29 years in 2014 to 31 years in 2020.
- Almost three-quarters (73.1%) of cases reported over the period were **male**.
- The proportion of cases recorded as **homeless** increased from 8.5% in 2014 to 10.5% in 2020.
- The proportion of cases with an **Irish Traveller** ethnicity was 3.2% in 2014 and 3.0% in 2020.
- The proportion of cases recorded as **unemployed** decreased from 64.4% in 2014 to 59.0% in 2020.
- The proportion of cases **in paid employment** increased from 8.3% in 2014 to 16.2% in 2020.
- In 2020, 13.8% of cases treated for problem drug use were **residing with children** aged 17 years or younger.

NDTRS cases 2014 to 2020

This bulletin presents NDTRS drug treatment data for the seven-year period from 2014 to 2020.¹ Data in this bulletin supersede all data previously published by the NDTRS.

The National Drug and Alcohol Strategy *Reducing Harm, Supporting Recovery: A Health Led Response to Drug and Alcohol Use in Ireland 2017–2025* requires all publicly funded drug and alcohol services to complete the NDTRS for all people who use services (action item 5.1.47). Included in the NDTRS are cases treated in all types of services: outpatient, inpatient, low threshold, general practitioners, and those treated in prison.²

NDTRS data for 2020 should be interpreted in the context of COVID-19. In 2020, there was an overall drop in the number of cases entering drug treatment which in part was the result of temporary service closures and measures introduced to comply with Covid-19 restrictions. This does not necessarily indicate a real decline in demand for treatment. High quality data are vital more than ever for measuring and understanding the impact of COVID-19 on addiction and addiction treatment in Ireland.^{3,4}

Between 2014 and 2020, a total of 68,571 cases treated for problem drug use (excluding alcohol) were reported to the NDTRS.⁵

The number of treated cases recorded decreased from 9,890 in 2014 to 9,702 in 2020 (**Table 1**). Between 2019 and 2020, the number of treated cases decreased by 9.0%, from 10,664 cases to 9,702 cases.⁶

New cases (never treated before) increased in proportion from 38.2% in 2014 to 39.1% in 2020. The proportion of previously treated cases decreased slightly from 57.1% in 2014 to 56.1% in 2020.

Type of service provider

Outpatient facilities accounted for the majority of cases treated over the period (63.6%). In 2020, 70.2% of cases were treated in outpatient facilities, an increase from 63.2% in 2014 (Table 2).⁷

The proportion of treated cases reported by residential (inpatient) settings increased from 13.6% in 2014 to 20.4% in 2016, then decreased to 12.3% in 2020. Between 2019 and 2020, the number of cases treated in residential settings decreased by 24.3%, from 1,571 cases to 1,190 cases. The reduction in residential case numbers can in part be attributed to temporary closures and measures introduced to comply with COVID-19 restrictions.

The proportion of cases treated in low threshold settings decreased from 12.0% in 2014 to 9.0% in 2020.

The proportion of cases treated in prison decreased from 8.5% in 2014 to 7.8% in 2020.

Due to COVID-19 restrictions, the collection of data from general practitioners was limited for much of 2020. The proportion of cases treated by general practitioners decreased from 2.6% in 2014 to 0.8% in 2020.

* Includes any service where the client stays overnight, e.g., in-patient detoxification, therapeutic communities, respite and step down

Main problem drug

All cases

Opioids (mainly heroin) remain the main problem drug reported over the period. As a proportion of all cases treated, opioids decreased year-on-year from 50.0% in 2014 to 36.7% in 2020 (**Table 3**).

Cocaine was the second most common main problem drug reported in 2020. The proportion of cases treated for cocaine as a main problem increased from 8.6% in 2014 to 27.0% in 2020.

Cannabis was the third most common main problem drug reported in 2020. The proportion of cases treated for cannabis as a main problem decreased from 27.6% in 2014 to 21.9% in 2020.

Benzodiazepines were the main problem for 11.3% of cases in 2020, an increase from 9.6% in 2014.

The proportion of cases with **Z-drugs** as a main problem decreased from 1.6% in 2014 to 0.7% in 2020.

MDMA (ecstasy), amphetamines, and volatile inhalants each continued to account for a small proportion of all treated cases in 2020.

In 2020, 22 (0.2%) cases reported pregabalin (Lyrica) as a main problem, a decrease from 39 cases in 2019. A further 80 cases reported pregabalin as a secondary problem in 2020, a decrease from 88 in 2019.

New cases

In 2020, cocaine (35.8%) was the most common main problem drug reported by new cases, replacing cannabis which was the most common main drug among new cases from 2014 to 2019 (**Table 3**). Cocaine was followed by cannabis (35.2%) and opioids (14.5%) in order of frequency among new cases.

Among new cases, cocaine increased from 11.3% in 2014 to 35.8% in 2020.

The proportion of new cases reporting cannabis as a main problem decreased steadily from 44.9% in 2014 to 35.2% in 2020.

The proportion of new cases reporting opioids as a main problem drug decreased from 27.4% in 2014 to 14.5% in 2020.

Previously treated cases

In 2020, opioids (52.5%) were the most common main problem drug reported by previously treated cases, followed by cocaine (20.7%), cannabis (12.7%), and benzodiazepines (11.6%).

Among previously treated cases, the proportion reporting opioids decreased from 64.8% in 2014 to 52.5% in 2020.

The proportion of previously treated cases reporting cocaine as a main problem increased from 6.8% in 2014 to 20.7% in 2020.

The proportion of previously treated cases reporting cannabis as a main problem decreased from 16.5% in 2014 to 12.7% in 2020.

Among previously treated cases, the proportion reporting benzodiazepines increased from 8.6% in 2014 to 11.6% in 2020.

Polydrug use

Over the period 2014 to 2020, the majority of cases (58.0%) reported polydrug use (problem use of more than one substance).

The proportion of cases that reported polydrug use decreased from 59.6% in 2014 to 53.4% in 2018, then increased to 58.6% in 2020 (**Table 4**).

In 2020, cannabis (39.5%) was the most common additional substance reported by cases with polydrug use, followed by cocaine (36.8%), benzodiazepines (36.5%), and alcohol (34.9%) (**Table 5**).

In 2020, and for the first time in the reporting period, cannabis ranked above alcohol as an additional substance among cases with polydrug use. The proportion of cases reporting cannabis as an additional substance increased from 34.1% in 2014 to 39.5% in 2020.

Similarly in 2020, and for the first time in the reporting period, cocaine was more common than alcohol as an additional substance. Cocaine was also reported more frequently than benzodiazepines in 2020, in contrast to the trend in the preceding years. The proportion of cases reporting cocaine as an additional substance increased from 21.9% in 2014 to 36.8% in 2020.

Opioids were reported as an additional substance by 18.7% of cases with polydrug use in 2020, similar to the rate of 18.3% reported in 2014.

Among *new cases* with polydrug use, alcohol (48.1%) was the most common additional substance in 2020, followed by cannabis (38.2%), cocaine (31.4%), and benzodiazepines (27.6%) (**Table 5**).

The proportion of new cases reporting cocaine as an additional problem increased from 22.6% in 2014 to 31.4% in 2020.

~ Cells with five cases or fewer

Risk factors

Risk factors of interest to the NDTRS include injecting behaviour, sharing of needles and syringes, and sharing of other drug paraphernalia (such as joints, straws, foil, pipes, spoons, filters, citric, water to mix drugs, and water or bleach to clean equipment).

Injecting behaviour

The proportion of all cases that had ever injected decreased from 35.7% in 2014 to 23.3% in 2020 (**Table 6**).

Among new cases, the proportion that reported ever injecting decreased over the period from 17.0% in 2014 to 5.1% in 2020.

The proportion of previously treated cases that reported ever injecting decreased from 48.4% in 2014 to 36.6% in 2020.

Among cases that had ever injected, the proportion currently injecting (i.e., in the 30 days prior to treatment) decreased from 37.0% in 2014 to 31.1% in 2020.

Sharing of drug paraphernalia

Prior to 2016, information on sharing of any drug paraphernalia, including needles and syringes was collected in a single question. To comply with reporting requirements of the European Monitoring Centre for Drugs and Drug Addiction (EMCDDA), this question was changed in 2016 so that sharing of 'needles and syringes' is now recorded separately from sharing of 'other drug paraphernalia'.

The transition to the new question resulted in an initial poor response whereby the data for 2016 to 2018 are not reported (**Table 6**). However, improved responses mean that from 2019, data can be reported. Data validation will continue to improve the quality of the responses however these data should still be interpreted with caution given the high number of unknown values.

In 2020, 37.8% of cases that had ever injected had ever shared needles and syringes.

Socio-demographic characteristics

- The median age of cases increased over time from 29 years in 2014 to 31 years in 2018 and has remained stable at 31 years since **(Table 7)**. For new cases, the median age increased from 25 years in 2014 to 27 years in 2020.
- In 2020, 6.9% of all cases were aged 17 years or younger. Among new cases in 2020, the proportion aged 17 years or younger was 14.4%.
- Over the period, almost three-quarters (73.1%) of cases reported were male. In 2020, 73.9% of cases were male, while females accounted for 25.9% of cases (gender was unknown for 0.2% of cases).
- The proportion of cases recorded as homeless increased from 8.5% in 2014 to 10.5% in 2020.
- The proportion of cases with an Irish Traveller ethnicity was 3.2% in 2014 and 3.0% in 2020.⁸
- The proportion of cases recorded as having ceased education (for the first time) before the age of 16 years decreased from 35.2% in 2014 to 32.5% in 2020.
- The proportion of all cases that were in paid employment increased from 8.3% in 2014 to 16.2% in 2020.
- Over the reporting period, 62.0% of all cases were unemployed. The proportion of cases that were unemployed decreased from 64.4% in 2014 to 54.9% in 2019, then increased to 59.0% in 2020.
- In each year, rates of homelessness, ceasing education before age 16, and unemployment were higher among previously treated cases than among new cases.
- In 2020, 13.8% (1,343) of cases treated for drugs were *residing with children* aged 17 years or younger.⁹ Males accounted for 54.7% (735), and females 45.2% (607) of these cases (gender was not known for one case).
- A quarter of cases (24.4% or 2,363 cases) treated for drugs in 2020 had children aged 17 years or younger who were *not residing with them*.¹⁰ Three quarters of these cases (74.6%) were males, and a quarter were females (25.4%).

Cocaine

This section focuses on the socio-demographic characteristics of cases with cocaine as a main problem drug (**Table 8**). In 2020, 2,619 cases were recorded with cocaine as a main problem, an increase from 853 cases in 2014.

The median age when entering treatment was 30 years in both 2014 and 2020 and was relatively stable in the period between.

The proportion of cases aged 17 years or younger was 2.0% in 2014 and 1.7% in 2020.

In each year, males accounted for the majority of cases (4 of every 5) with cocaine as a main problem. The proportion of female cases increased from 17.2% in 2014 to 20.8% in 2020.

The proportion of cases in paid employment increased from 19.9% in 2014 to 35.0% in 2018, then decreased to 30.2% in 2020.

The proportion of cases with polydrug use decreased from 70.2% in 2014 to 63.3% in 2020. In 2020, the most common additional drugs were alcohol (53.9%), cannabis (49.8%), and benzodiazepines (31.7%).

In 2020, crack cocaine accounted for 15.8% of all cases treated for cocaine as a main problem (compared to 14.3% in 2019).

A breakdown of cocaine cases by county of residence is presented in Appendix A.

Community Healthcare Organisation (CHO) area of residence

In 2020, the highest number of reported cases resided¹² in CHO 9 (**Table 9**) (see below for reference to areas included in each CHO). As participation in the NDTRS is not uniform across the country, conclusions based on geographic analyses are limited.

Table 9: Number of cases treated for drugs as a main problem by Community Healthcare Organisation area of residence, NDTRS 2014 to 2020

CHO 9 – Dublin North LHO, Dublin North Central LHO and Dublin North West LHO

Incidence and prevalence of treatment

Annual rates for the incidence (new cases) and prevalence (all cases) of treated problem drug use were calculated per 100,000 of the population aged 15 to 64 years based on census figures from the Central Statistics Office (CSO) ¹³ **(Figure 1)**.

Incidence was 119.3 per 100,000 in 2014 and 119.8 per 100,000 in 2019. In 2020, incidence was 114.2 per 100,000.

Prevalence, which includes new cases and those cases returning to treatment, increased from 316.2 per 100,000 in 2014 to 325.8 per 100,000 in 2019. In 2020, prevalence was 294.5 per 100,000.

Changes in incidence and prevalence should be interpreted with caution due to the proportion of cases where treatment status was unknown (4.8% in 2020) and the impact of COVID-19 on case numbers for 2020 **(Table 1)**.

Figure 1: Incidence and prevalence of treated problem drug use per 100,000 of the 15 to 64 year-old population, NDTRS 2014 to 2020

Acknowledgements

The NDTRS team would like to acknowledge the ongoing support of the staff in the alcohol and drug treatment services throughout the country, without whom it would not be possible to maintain the NDTRS. Their participation and cooperation are very much appreciated and valued, and especially so in a year that has been extremely challenging due to the COVID-19 pandemic and related restrictions.

Notes

1. This document may be cited as: Kelleher C, Carew AM, and Lyons S (2020) *Drug Treatment in Ireland 2014 to 2020*. HRB StatLink Series 6. Dublin: Health Research Board. Available at: www.drugsandalcohol.ie/34162 and at www.hrb.ie/publications.
2. More detailed information on the NDTRS methodology can be found in previously published HRB Trends Series papers at: www.hrb.ie/fileadmin/publications_files/HRB_Trend_Series_12_Trends_in_treated_problem_drug_use_in_Ireland_2005_to_2010_02.pdf
3. The capacity and functionality of treatment services were impacted by COVID-19 restrictions. The NDTRS surveyed participating services to estimate the impact of the restrictions on treatment data for 2020 (the response rate was 80%). Around 40% of services surveyed expressed some impact on their ability to provide returns, while around 50% expected some impact on numbers (unpublished data).
4. To comply with EMCDDA requirements, and to enable services to accurately reflect their activities in response to COVID-19 restrictions, the NDTRS added functionality to the LINK database to record treatment provided over the telephone or internet (teleworking).
5. NDTRS data are case-based which means there is a possibility that individuals appear more than once in the database; for example, where a person receives treatment at more than one centre, or at the same centre more than once in a calendar year.
6. The NDTRS interactive tables will be updated to reflect the changes at: www.drugsandalcohol.ie/tables/
7. Coverage of services was 71.1% for 2020. The number of services participating in the NDTRS varies annually, making small fluctuations in the numbers of cases difficult to interpret.
8. Based on the 2016 Census, the proportion of Irish Travellers in the general population is 0.7% (Central Statistics Office, 2020) www.cso.ie/en/releasesandpublications/ep/p-cp8iter/p8iter/p8e/
9. Service users *currently residing with children* refers to the 30 days prior to treatment. This includes children where the service user has a carer or guardianship role; non-related children such as foster children and stepchildren; and the children of a long-term cohabiting partner. Where the service user is a grandparent or other close relative and is the official guardian of a child with whom they are living, they are recorded as living with children.
10. Children who are *not residing with* the service user refers to children currently living with another parent; children in formal care or informal care; and children living elsewhere who are biological children/adopted children, or children who are under the official

guardianship of the service user. It also refers to children who have left home, and children who are living with other family members or friends temporarily, but who are not considered by the service user to be living in care.

11. Age range presented is 5th percentile to 95th percentile (90% of cases are included within this range).
12. Area of residence relates to the service user's place of residence in the 30 days prior to commencing treatment, for all service types excluding prison. Where a service user is treated in prison and has been in prison for less than six months prior to starting treatment, area of residence is the place of residence prior to imprisonment. Otherwise, the prison location is recorded.
13. Population data are taken from the Central Statistics Office at: www.cso.ie/en/releasesandpublications/er/pme/populationandmigrationestimatesapril2020/
