## REPORT ON VITAL STATISTICS FOR THE YEAR 1985

This Report has been prepared by the Central Statistics Office for the Minister for Health in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952.

The statistics relate to the area in Ireland exclusive of Northern Ireland.

Births are classified according to the area of residence of the mother and deaths according to the area of residence of the deceased.

The number of births and deaths for each of the years 1943 to 1985 is exclusive of late registrations and the number of deaths for each of the years 1940 to 1967 is exclusive of non-residents. From 1968 however, the number of deaths included non-residents.

The main statistics contained in this Report have already been published, and the Report consists mainly of a breakdown and analysis of these.

Prior to 1970, births and deaths were classified according to year of registration. In order to comply with United Nations regulations it was decided to classify births and deaths by year of occurrence from 1970 onwards. Because of this change in the basis of classification, those births and deaths which occurred in 1969 but were registered in 1970 have been recorded neither in the 1969 nor in the 1970 Report on Vital Statistics. The number of births excluded on this account was 2,545 and the number of deaths, 2,279. Appendix tables to the 1971 Report show these births classified by age of mother at maternity and number of previous children, while the deaths are classified by cause, sex and age group.

NOTE: More up to date information on Vital Statistics is published in the Quarterly Report on Births, Deaths and Marriages and on certain Infectious Diseases published about five months after the end of the quarter to which the data relate. In the Quarterly Report births and deaths are classified according to quarter of registration.

## GENERAL SUMMARY

**Marriages:** - There were 18,791 marriages registered during the year 1985 compared with 18,513 in 1984. The marriage rate per 1,000 population was 5.3 compared with 5.2 in 1984.

**Births:** - The number of births occurring during 1985 was 62,388, 32,068 males and 30,320 females. The birth rate was 17.6 per 1,000 population compared with 18.2 per 1,000 population in 1984. The number of illegitimate births occurring in 1985 was 5,282 or 8.5 per cent of all births.

**Deaths:** - The number of deaths occurring during 1985 was 33,213, 18,201 males and 15,012 females. The death rate was 9.4 per 1,000 population. In 1984 deaths numbered 32,076 and the rate was 9.4.

Of the deaths occurring in 1985, 35.0 per cent were stated to be due to ischaemic and other forms of heart disease, 14.7 per cent to other diseases of circulatory system, 20.1 per cent to cancer and 13.9 per cent to diseases of respiratory system.

There were 6,689 deaths from malignant neoplasms and neoplasms of lymphatic and haematopoietic tissues. Of these, 37 were caused by Hodgkin's disease and 179 by leukaemia and aleukaemia. The death rate for cancer (Nos. 140-208) in 1985 was 1.89 per 1,000 population the same as that for 1984.

During 1985 the number of deaths occurring of infants under one year was 552 compared with 617 in 1984 giving rates of 8.8 and 9.6 respectively per 1,000 live births.

The total number of deaths from accidents and other external causes in 1985 was 1,488 of which motor vehicle accidents accounted for 475 deaths. The corresponding figures for 1984 were 1,436 and 503 respectively. Marriage, birth and death rates per 1,000 population for the years 1953 to 1985 are illustrated in Diagram 1.

NOTE: In June 1985 an Air India jet crashed off the coast of Ireland resulting in the death of 329 non-residents. These deaths have been excluded from all the tables.

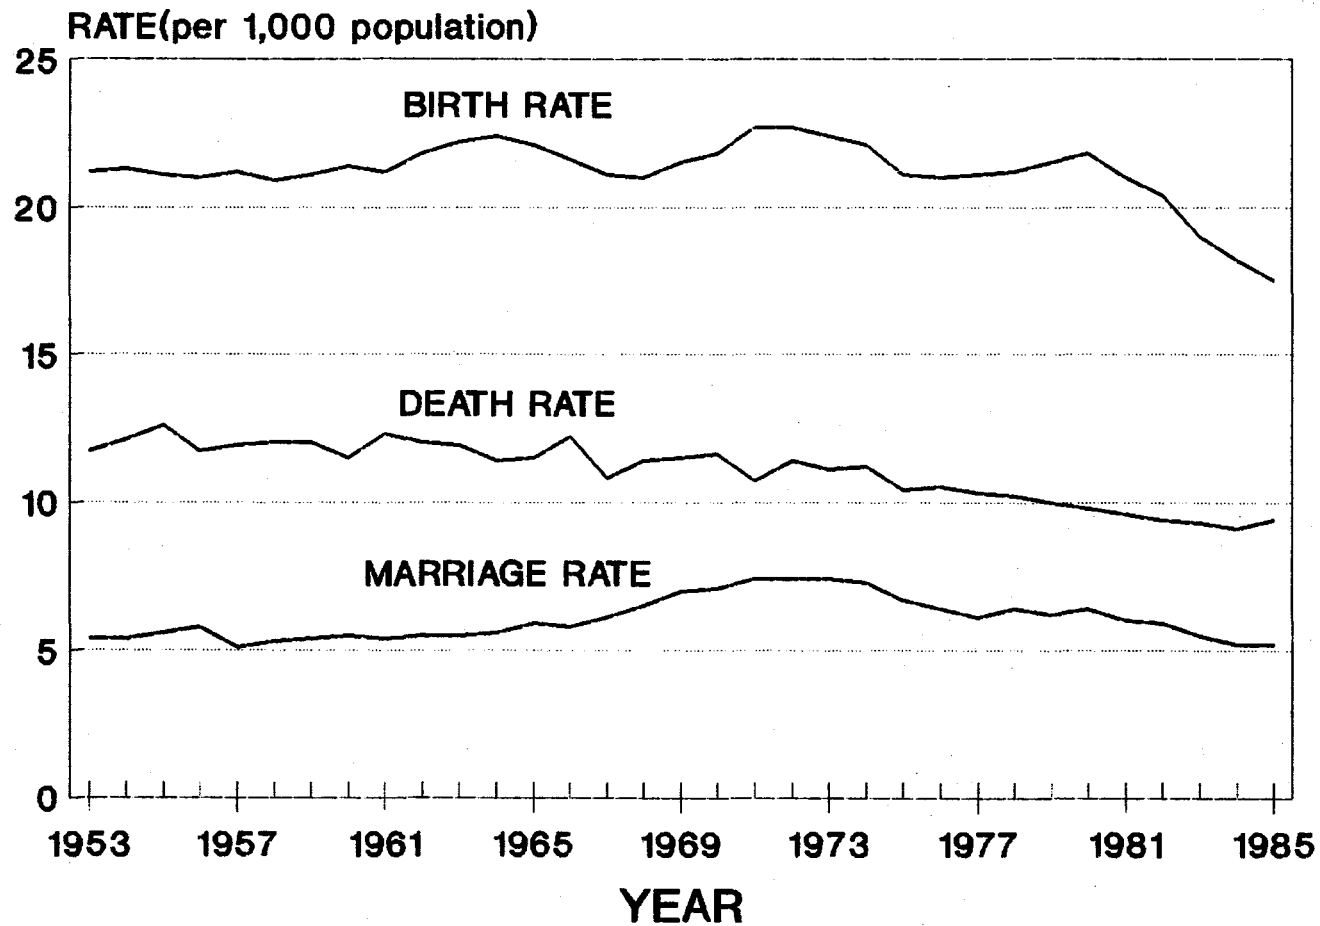

**Issue of Authority for Registration.** - Births and deaths which have not been registered within one year of their occurrence can be registered only on the authority of An tArd Chlaraitheoir (Registrar General). The number of such births registered on the authority of An tArd Chlaraitheoir in 1985 was 1,403 and the number of such deaths registered was 388. Throughout the tables in this Report these births and deaths have been excluded.

Tables containing an analysis of late death registrations in 1985 are included in the Appendix of this Report.

**Population.** - The estimated population in April 1985 was 3,540,000; 1,771,000 males and 1,769,000 females.

## MARRIAGES

The number of marriages registered in 1985 was 18,791, an increase of 278 on the previous year; the rate was 5.3 per 1,000 population, 0.1 above that for 1984. Tables 4 and 5 of this Report show the average numbers of marriages registered and marriage rates for 10-year periods since 1864 and by single years since 1971. The following table compares the marriage rate in Ireland in the years 1941 to 1985 with those in Northern Ireland, England and Wales and Scotland.

## AGE AT MARRIAGE

Particulars of the ages of persons marrying in this country were obtained at the 1946 Census of Population. At that Census persons were asked to state their date of marriage and a special analysis was made of 14,338 marriages which had taken place in the preceding twelve months and in the case of which the husband and wife were enumerated on the same census schedule. Corresponding data have been available since 1957 from marriage registrations and the results obtained since have made possible an examination of the trends in age at marriage over the intervening period, which are summarised in the following table.

TABLE II

In 1985, there was a decline in the proportion of grooms and brides at ages under 25 years and a significant increase in the proportion of grooms and brides in the 25-34 year age group. The average age at marriage has more or less stabilized in the last few years; the average age for males being 27.4 years and for females, 25.3 years. In TABLE 46 marriages registered in 1985 are shown cross-classified by age of groom and age of bride in single years while in TABLE 47 similar particulars are shown for marriages between bachelors and spinsters. From the latter table it may be calculated that the average ages of bachelors and spinsters marrying in 1985 were 27.1 and 25.0, respectively. A comparison of first marriage rates per 1,000 single population in each age group in Ireland and in England and Wales in 1985 is made in Table III. The figures were obtained by dividing the number of single males marrying in each group by the total number of single males in that age group and similarly for females.

\* Exclusive of Northern Ireland + 16-19 years for England and Wales

For each sex the marriage rates in Ireland were considerably below those in England and Wales in the two younger age groups. In the 25-39 year age groups in England and Wales the rates for both males and females were lower than the Irish rates in 1985. In the age groups 40 years and over the rates for England and Wales were significantly higher.

#### MODE OF CELEBRATION

The number of marriages celebrated in accordance with the rites and ceremonies of the Catholic Church registered in 1985 amounted to 17,724 (equivalent to 94.3 per cent of the total) and other marriages numbered 1,067, of which 364 were according to the rites and ceremonies of the Church of Ireland, 73 in Presbyterian Churches, 35 in Methodist Churches, 1 according to Jewish rites, 13 in accordance with the rites and ceremonies of other religious denominations and 581 by civil contract in Registrar's Office.

The rate for Catholic marriages in 1985 was 5.3 per 1,000 of the Catholic population, an increase of 0.1 on the corresponding rate for 1984. The rate for all other marriages combined was 6.0 per 1,000 of the population other than Catholic, a decrease of 0.4 on the previous year's rate.

+Average annual number of marriages and rates for decennial periods 1941-1970

Marriages are classified according to form of ceremony, age of groom and age of bride in TABLES 48 and 49. For Catholic marriages the average age of the groom was 27.2 years compared with 29.7 years for other marriages (including Civil marriages). The average age of the bride for Catholic marriages was 25.2 years and for other marriages, 27.2 years.

#### SOCIO-ECONOMIC GROUP

A classification which has been widely used in recent years in Census of Population statistics is that by socio-economic group. This classification is determined by a person's occupation or, in some cases, by a combination of occupation and employment status. The socio-economic group of a person not gainfully occupied is considered to be that of the gainfully occupied person on whom he or she is deemed to be dependent. The men and women married in 1985 were classified by socio-economic group on the basis of the information as to occupation given in the marriage register and the results obtained are given in TABLES 50 to 52.

In TABLES 50 and 51 grooms and brides are classified by socio-economic group and age at marriage in each group. For both grooms and brides the average marriage age in 1985 was higher in the social group "Farmers, farmers' relatives assisting and farm managers" than in any other group and the lowest average was in the "other manual workers" group.

TABLE 52 shows marriages registered in 1985 cross-classified by the social groups of groom and bride. From the table it will be observed that the highest number of marriages among males occurred in the "skilled manual workers" group and accounted for 31 per cent of the grooms excluding the "not stated" cases. The highest among females was in the "Intermediate non-manual workers" group and accounted for 45 per cent of the brides. The table may also be examined by considering the socio-economic groups of the men marrying the women in each particular socio-economic group. Thus it will be seen that only 28 per cent of the women stated to be in the socio-economic group "Farmers, farmers' relatives assisting and farm managers" married men in socio-economic groups other than their own. A substantial number of the women in the "Intermediate and other non-manual workers" groups married men in each of the other socio-economic groups. In the case of the majority of women in the "manual workers" groups, the husbands belonged to the same groups.

#### AREA OF RESIDENCE

Four districts may be considered in relation to each marriage, namely that in which the marriage took place, the areas of residence of the bride and groom prior to marriage, and the intended future residence. In TABLE 45, figures for marriages according to the place of occurrence are given for 1985. A comparison between the area of residence of the bride before the ceremony and the area in which the marriage took place is made in Table V.

In TABLES 53 and 54 marriages are shown classified by area of residence prior to marriage and age group of groom and bride. Confining attention to the marriages in the case of which the area of residence was within the State, it will be seen that the average age at marriage for men is lower in predominantly urban than rural areas. Thus, in the four county boroughs the average age of grooms was not over 26.9 years, whereas in County Leitrim, the average age was 28.6. The average age for brides was lowest in Limerick County Borough, 24.3 and highest in Dublin County Borough, 25.4. The lowest average age of brides in the counties was in County Offaly, 24.2 and highest in County Roscommon, 26.1.

In TABLE 55 marriages are cross-classified by area of residence before marriage of groom and bride. As is to be expected, in the great majority of cases the groom and bride were from the same or neighbouring counties. A feature of the table is the large number of cases in which the address of the groom or bride or of both groom and bride were outside the State. Thus, 540 of the men married in the State in 1985 were returned as residing in England, Wales or Scotland, 255 in Northern Ireland and 280 in other countries. The number of brides who were resident before marriage in England, Wales or Scotland was 337, the number from Northern Ireland was 102 and the number from other countries was 124. In 462 cases both the groom and bride were from outside the State. In the past it has been the practice to compute marriage rates for counties and county boroughs by relating the marriages registered in each area to the resident population of that area.

It will be observed that rates (a) and (b) differ on account of the fact that marriages of men whose area of residence was outside the country were included in the calculation of rate (a) and excluded from rate (b). In the case of the question on intended future permanent residence, the accuracy of many of the entries was not as high as for the other information supplied. There were 463 marriages registered in which no information on future residence was provided.

1984	18,513	1,149	6.2
1985	18,791	1,345	7.2

It will be observed from Table VII that the proportion of marriages with intended future residence outside the State has shown an increase for each of the years 1983 and 1984. The figure of 1,345 in 1985 represents an increase of 196 since 1984. In the case of 637 marriages the future residence was in England and Wales, 219 in Northern Ireland, 38 in Scotland, 119 in other parts of Europe, 166 in the United States of America, 39 in Canada, 52 in Australia and New Zealand and 75 elsewhere. The age distributions and average ages of the grooms and brides going to the various countries are shown in TABLES 56 and 57 respectively. It will be seen that the average age of the men and women marrying and then going abroad was somewhat above the level of that for all marriages in the State. The marriages of persons going abroad are shown classified by socio-economic groups of groom and bride in TABLES 58 and 59 respectively. By comparing TABLES 50 and 58 it is possible to examine the proportions of men marrying in each socio-economic group who intended to reside outside the country, and it is found that this proportion varied considerably between the different groups. Table VIII contains the results obtained.

A classification of marriages of persons going abroad by form of marriage ceremony, is made in TABLE 60. With the aid of this Table it may be calculated that in 1985 in the case of Catholic marriages the percentage with intended future residence outside the State was 7 per cent, compared to 6 per cent in 1984. The corresponding figures for all other marriages were 14 per cent in 1985 and 13 per cent in 1984.

Finally, in TABLES 61 and 62, the marriages in the case of which the intended future residence was outside the State are shown classified by area of residence before marriage of groom and bride. The proportions which these marriages represent of the total when classified according to area of residence of groom are shown in Table IX.

## BIRTHS

The number of births occurring during the year 1985 was 62,388, comprised of 32,068 males and 30,320 females. The corresponding figures for 1984 were 64,062, 33,222 and 30,840 respectively. The birth rate in 1985 was 17.6 per 1,000 population, compared with 18.2 in 1984.

## CLASSIFICATION BY AGE AT MATERNITY, PARITY AND DURATION OF MARRIAGE

TABLE 42 shows the total number of births which occurred in 1985 classified by age of mother at maternity and number of previous liveborn children. The number of births in the case of which the mother's age was not stated was 951 or 1.5 per cent of the total. In 1984 the corresponding figure was 747 or 1.2 per cent of the total. The results contained in TABLE 42 are summarised in Table XI.

In preparing this table the procedure in the case of multiple births was to count each child as an individual birth. For instance if a fifth pregnancy produced twins, the children would be classified as a fifth and sixth child in parity order.

Between the mid 1960's and the mid 1970's there was a trend towards the younger age groups in the distribution of births according to the age of mother at maternity and by 1975 mothers under 30 years accounted for 61.7 per cent of births. Subsequently the proportion declined fairly steadily to reach 58.1 per cent in 1984 and 56.8 in 1985. The corresponding figures for England and Wales and Scotland for 1985 were 72.9 per cent and 76.2 per cent respectively.

In each age group the number of legitimate births per 1,000 married women was considerably higher in Ireland than in England and Wales. In the 15-19 year group the Irish rate in 1985 was 40 per cent above that in England and Wales, in the 20-24 year group 42 per cent greater, while the excess in the Irish rate rose steadily with increasing age. The number of illegitimate births per 1,000 single, widowed and divorced women was appreciably lower at all ages in Ireland than in England and Wales. On account of the much higher proportion of women married at the younger ages in England and Wales the fertility rates for all women combined were higher in England and Wales than in Ireland in the 15-19 and 20-24 year groups but at the later ages the Irish rate was considerably higher.

The total number of illegitimate births was 5,282 being 166 more than in 1984. This was equivalent to an annual rate of 14.5 per 1,000 unmarried females aged 15-49 years and was 8.5 per cent of total births. The number of illegitimate births has shown an increase every year since 1959 when the lowest ever number was recorded.

The percentage distribution of births according to the number of previous children in 1984 and 1985 is shown in Table XV and a comparison made with the corresponding distributions in England and Wales and Scotland in 1985.

+ Legitimate births

The difference between the years 1984 and 1985 in respect of the percentage distribution according to number of previous children was slight. The percentage of women with large families was considerably higher in Ireland than in England and Wales or Scotland. In Ireland in 1985, 6.9 per cent of the mothers had 5 or more previous children, the corresponding percentages being only 1.2 in England and Wales and 0.7 in Scotland.

#### MULTIPLE BIRTHS

The number of maternities in 1985 which resulted in multiple live births was 651 consisting of 644 sets of twins, and 7 sets of triplets. This is equivalent to a "twinning rate" (number of live twins per 1,000 maternities which resulted in live births) of 10.4. Table XVI summarises the number of multiple births and the "twinning rate" for the years 1975 to 1985.

## DEATHS

The number of deaths occurring during the year 1985 was 33,213 of which 18,201 were those of males and 15,012 were those of females equivalent to a rate of 9.38 deaths per 1,000 total population compared with 9.10 in the previous year, and 9.40 in 1983.

In Table 9 are shown the annual average death rates, by age group, for decennial periods from 1864 to 1970 and the death rates for each year 1971 to 1985.

While the crude death rate per 1,000 population has shown a gradual downward trend since the beginning of the century, striking falls occurred in the death rates at the younger ages.

Table XVII compares the death rates in the years 1941-1985 with those in Northern Ireland, England and Wales and Scotland. The death rate in this country in 1985 was lower than in England and Wales and Scotland. Over the period covered in the table the decrease in this country has been greater than that in any of the other areas.

Attention should be drawn to the fact that these comparisons are based on crude death rates, which are to some extent affected by differences in the age-sex structures of the population in the different countries, while comparisons over a period of years are also affected by changes in the age-sex structures of the population.

## COMPARISON BETWEEN COUNTIES

A difficulty arises when comparisons are made between the death rates in different regions of the country, due to the fact that the age distribution of the population varies considerably from one county to another. Thus, if a particular county contains a large proportion of elderly persons the crude death rate per 1,000 population will be relatively high even if the health conditions in that county are better than the general average. To overcome this difficulty standardised rates are prepared. For a particular county this is done by calculating the death rate in each age group of the population in that county and then multiplying the death rate in each age group by the population in the whole country in that age group and summing the resulting products. This sum is then divided by the total population in the country at all ages to decide the standardised rate for the county.

In certain areas the standardised death rates differ appreciably from the crude rates, the extremes being in Dublin County Remainder which had a crude death rate of 4.26 and a standardised rate of 8.44 reflecting the very young age structure in Dublin County and in Leitrim where standardisation has the effect of lowering the death rate from 15.04 to 9.88 because of the comparatively old age structure in that county. The standardised rates in 1985 were lowest in Waterford County Borough, 8.38, and highest in Limerick County Borough, 11.45.

## Causes of Death

The Ninth Revision of the International Classification of Diseases, Injuries and Causes of Death (I.C.D.9) as recommended by the World Health Organisation came into operation on the 1st of January 1979. This replaced the Eighth Revision (I.C.D.8) which was used from 1968 to 1978. The Ninth Revision was used for the first time in classifying deaths by causes in the 1979 Report. To facilitate linkage with previous years all deaths in 1979 were, in addition, coded according to the Eighth Revision of the International Classification of Diseases. A cross-classification of deaths occurring in 1979 by the Eighth and Ninth Revision is contained in Tables 60-63 of the 1979 Report.

As the Ninth Revision imposes certain changes in interpretation of recorded medical opinion regarding the underlying cause of death when more than one disease is mentioned on the medical certificate of Cause of Death, care should be taken in comparing deaths coded according to the Ninth Revision with those for previous years.

## Injury and Poisoning:-

This category now forms part of the main body of classification and deaths coded accordingly are shown in Table 19.

## External Causes of Death:-

The role of the E-code has changed. In the Sixth, Seventh and Eighth Revisions the E-code was considered as part of the main classification. In the Ninth Revision the E-code is treated as a supplementary classification to be used where relevant in conjunction with codes from any part of the main classification.

From Table XIX it can be seen that heart diseases remained the single biggest cause of death. While the number of deaths due to heart disease has remained relatively unchanged since 1960-62, the rate per 100,000 population has declined steadily. The number of deaths due to cancer increased by 31 per cent between 1960-62 and 1980-82 and has remained fairly static since then. There was a significant decline in the number of deaths from influenza since 1960-62, while the number of deaths due to other respiratory diseases has shown a steady increase since 1975-77. The significant decline in the number of deaths due to senility can be attributed to a decrease in the number of uncertified deaths and better certification of the cause of death.

Of the deaths occurring in 1985, 80 per cent were due to the four main causes, i.e. ischaemic and other forms of heart disease, malignant neoplasms, cerebrovascular disease and respiratory diseases. Diseases of the heart were responsible for the highest rates, 377 per 100,000 population for males and 279 per 100,000 females. Most of these deaths occurred at ages over 55. Malignant neoplasms were the next major cause, the rates for which were 210 and 168 for males and females respectively per 100,000 population. The rates for cerebrovascular disease were 84 and 114 respectively for males and females per 100,000 population; as in the case of heart diseases the greater number of these deaths occurred at ages over 55. The deaths from respiratory diseases were due mainly to pneumonia and bronchitis. Between the ages 5 to 34 years accidents were the greatest single cause.

Some of the principal causes of deaths are considered in greater detail in the following sections.

#### TUBERCULOSIS

In 1985 there were 115 deaths from tuberculosis, of which 77 were caused by the respiratory form and 38 by other forms of the disease. Between the period 1941-1950 and the year 1985 death rates from tuberculosis, particularly in the younger age groups, fell to a fraction of their former level. Of the 115 deaths in 1985, 97 per cent were in the age group 45 and over.

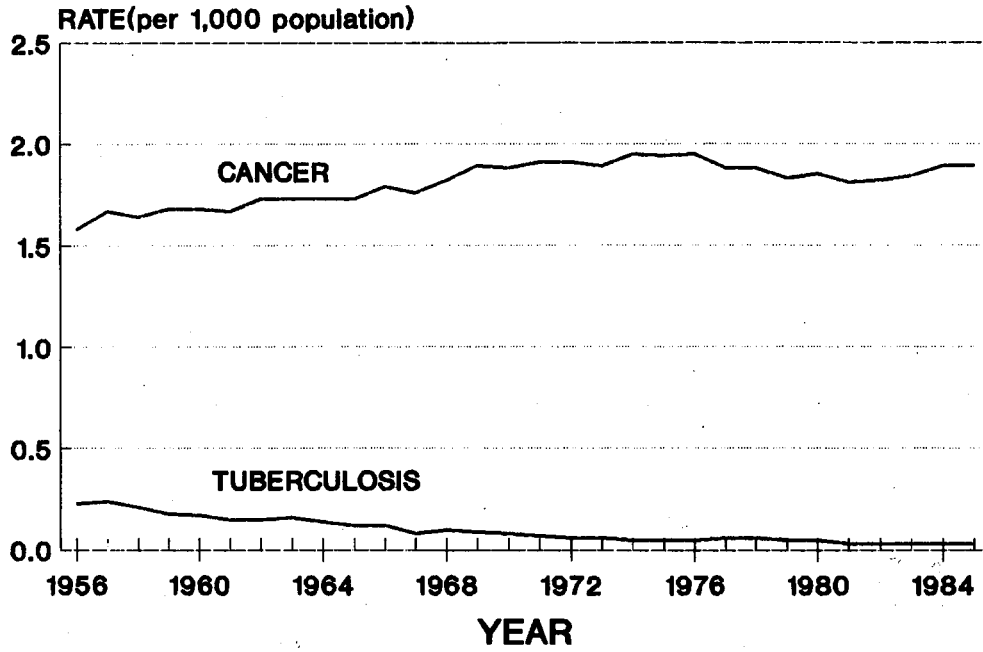

The mortality from tuberculosis in the counties and county boroughs in 1985 is compared in Table 12 of this Report.

## CANCER

Prior to 1950 under the Fifth Revision of the International List of causes of death, cancer deaths were those classified under 045-055. With the introduction of the Sixth Revision in 1950 the World Health Organisation recommended that total cancer deaths should be based upon Nos. 140-205 (Nos. 140-208 in the Ninth Revision) of the International Statistical classification which now included Hodgkin's disease and leukaemia, but for comparability with the years prior to 1950 the total cancer figure less Hodgkin's disease and leukaemia should also be shown.

In 1985 there were 6,689 deaths from cancer (Nos. 140 to 208). Of this number 37 deaths were caused by Hodgkin's disease and 179 by leukaemia and aleukaemia. Table XXII shows the death rate from cancer in certain age groups in the years 1974 to 1985.

In the years under review the death rates from cancer showed little difference between males and females in the age groups under 34 years but between the ages 35 and 54 years the female rates were generally greater than those for males. In 1985 the male death rate for all ages was 25 per cent above that for females. The trend in the death rates from cancer since 1956 is shown in diagram 3 but it should be noted that for reasons given earlier the figures plotted in this diagram exclude deaths from Hodgkin's disease, leukaemia and aleukaemia.

In the period under review the crude rates for England and Wales and Scotland were consistently higher than those for this country and Northern Ireland.

The death rates from cancer in 1985 in counties and county boroughs are compared in Table XXIV. Standardised rates, which eliminate the effect of different age distributions in the different areas are also shown. A map showing standardised death rates by county is given on page xxi.

The crude death rate from cancer in 1985 varied from 2.79 per 1,000 population in Leitrim to 1.03 in Dublin County Remainder. In certain areas, however, the standardised rates were considerably different from the crude rates and when comparing the relative seriousness of mortality in different counties it is, of course, the standardised rates which should be used. In the counties of the west and north-west, standardisation had the effect of lowering the death rates considerably. The standardised rates varied from 2.49 per 1,000 population in Limerick County Borough to 1.54 in Counties Roscommon and Donegal.

Full details of deaths due to cancer occurring in 1985, classified by site of the disease and age group are contained in TABLE 19. The number of deaths and death rates from cancer per 100,000 in each group for the main groups of sites are shown in Table XXV and it will be observed that there is in general a rapid rise in the death rate with increasing age. Deaths due to malignant neoplasms of the digestive system represented over one third of the total cancer deaths for males, and almost one third for females, the death rate for males being 28 per cent higher than that for females. The death rate from malignant neoplasms of the respiratory system for males was more than double that for females.

#### CANCER OF THE BRONCHUS, TRACHEA AND LUNG

The number of deaths and death rates from cancer of the bronchus, trachea and lung in each year 1974 to 1985, classified by sex and age group, are shown in Table XXVI.

The main point that emerges from this table is that deaths from cancer of the bronchus, trachea and lung are much more common among males than among females. In 1974 the death rate in the case of males was 55.1 compared with 20.1 in the case of females. In 1985 the corresponding rates were 62.8 and 24.3 respectively.

The following table shows deaths and death rates from cancer of the bronchus, trachea and lung in Ireland and neighbouring countries during the years 1980 to 1985.

The most significant feature of this table is the low rate in Ireland in each year compared with those in other areas. Throughout the period under review the yearly rates for England and Wales were almost double the Irish rates.

#### DISEASES OF THE CIRCULATORY SYSTEM

There were 16,492 deaths ascribed to diseases of the circulatory system (Nos. 390-459) in 1985, of which 8,850 were deaths of males and 7,642 of females. Details of these deaths, classified by cause and age may be obtained from TABLE 19 of this Report while the numbers assigned to each county and county borough are shown in TABLE 20. Deaths and death rates from certain groups of causes are given in Table XXIX.

The excess of male over female deaths in the case of diseases of the circulatory system is largely accounted for by the greater number of deaths of males from ischaemic heart disease (5,501 males compared with 3,440 females). In the case of deaths due to cerebrovascular disease there was an excess of female deaths (2,022 females compared with 1,494 males); in respect of the remaining groups of causes the difference between the male and female death rates is not nearly so pronounced.

## RESPIRATORY DISEASES

Deaths from respiratory diseases (Nos. 460-519 in the International List) in 1985 numbered 4,620. These included 59 deaths caused by influenza, 2,142 by pneumonia, 573 by bronchitis and 1,846 due to other respiratory diseases.

## PREGNANCY, CHILDBIRTH AND PUERPERIUM

The number of maternal deaths in 1985 was 4, the same as that for 1984. The death rate was 0.06 per 1,000 maternities. TABLE XXX shows the maternal deaths in 1985 classified by age of mother and cause. There were no deaths associated with pregnancy, childbirth and puerperium in 1985, other than those classified as maternal.

#### INFANT AND LATE FETAL MORTALITY

The terms used in relation to infant and late fetal mortality are defined as follows:

Infant death: Death at ages under 1 year of live born infant.

Early neo-natal death: Death at ages under 1 week of live born infant.

Neo-natal death: Death at ages under 4 weeks of live born infant.

Post-neo-natal death: Death between the ages of 4 weeks and 1 year of live born infant.

Late fetal death (stillbirth): Fetal death at or over 28 weeks gestation.

Perinatal deaths: Late fetal plus early neo-natal deaths.

Infant mortality rate: Infant deaths divided by total live births, multiplied by 1,000.

Neo-natal mortality rate: Neo-natal deaths divided by total live births, multiplied by 1,000.

Early neo-natal mortality rate: Early neo-natal deaths divided by total live births, multiplied by 1,000.

Late fetal mortality rate: Late fetal deaths divided by total live births plus late fetal deaths, multiplied by 1,000.

Perinatal mortality rate: Perinatal deaths divided by total live births plus late fetal deaths, multiplied by 1,000.

While statistics of infant mortality are obtained in the course of the usual procedure for registration of deaths, which has been in operation since the year 1863, particulars of late fetal mortality are obtained through a scheme of notification to the Directors of Community Care. The scheme of notifying late fetal deaths was introduced in 1957, but comparisons between different areas of the country showed marked differences in the coverage of the scheme in the early years. Consequently, the number of late fetal deaths in the early years of the scheme is believed to be understated.

It will be seen from Table XXXII that the highest individual rate for infant mortality was in County Clare and the lowest in County Kerry. The rate for perinatal mortality was highest in County Clare and lowest in County Galway while for late fetal mortality the highest rate was in County Westmeath and lowest in County Longford.

## INFANT MORTALITY

During the year 1985 there were 552 deaths of infants under one year, compared to 617 in 1984. The infant mortality rate has continued to decline over the years and the rate of 8.8 in 1985 was the lowest ever recorded. The rate in 1984 was 9.6.

The causes of deaths of infants under one year, classified according to the Detailed International List, are shown in TABLE 19. In TABLE 26 infant deaths are again classified by cause and a more detailed age classification shown. These results are summarised in Table XXXV.

TABLE XXXV  
 LATE FETAL DEATHS AND DEATHS OF INFANTS UNDER 1 YEAR OCCURRING IN 1985, CLASSIFIED BY CAUSE AND AGE.

	Total	516	172	88	68	224	552

It will be seen that the relative importance of the various groups of causes differ appreciably between deaths at certain ages under one week and deaths at ages 4 weeks to 1 year. Of all deaths at ages under one week, 40 per cent were due to congenital anomalies, anoxic and hypoxic conditions not elsewhere classified accounted for 21 per cent, immaturity and birth injuries 10 per cent.

At ages over 4 weeks sudden infant deaths and congenital anomalies were the main causes of death. Details of the 94 deaths included as other causes will be found in TABLE 19 where it will be noted that 6 of these were due to accidents.

## LATE FETAL DEATHS

The number of late fetal deaths notified in each year since the scheme was introduced is as follows :

Year	Late Fetal Deaths
Average 1957-1966	1,215

\* For definition see Page xxxv

More late fetal deaths resulted from placental and cord injuries to fetus than from any other group, being 26 per cent of the total deaths. Deaths due to intrauterine hypoxia and birth asphyxia were next at 24 per cent and congenital anomalies at 16 per cent. Deaths classified as being due to ill-defined conditions originating in the perinatal period accounted for 24 per cent of total deaths.

As can be seen from Table XXXVII 504 late fetal deaths in 1985 occurred in hospitals; this is equivalent to 98 per cent of the total number of late fetal deaths.

## ACCIDENTS, POISONING AND VIOLENCE

The number of deaths from external causes (Numbers E800-E999) occurring in 1985 was 1,488 of which 1,019 were males and 469 were females. The corresponding figures for 1984 were 1,436, 973 and 463 respectively. As has been mentioned on page vii, deaths which have not been registered within one year of their occurrence have been excluded from the main body of this Report. The exclusion of these cases may have a relatively more significant effect on the number of deaths classified to some external causes.

As can be seen from Table XL there is an excess of male mortality from accidents at all ages between 1 and 75 years. In these age groups, the excess of male deaths may be largely attributed to the category Road Vehicle Accidents. At ages over 75 years, the excess of female deaths may be attributed to accidental falls. The vast majority of these falls occurred in the home (Table XLI).

331 deaths resulting from accidents in the home were recorded in 1985 compared with 308 in 1984. As will be seen from TABLE XLI 165 deaths in 1985 were attributed to accidental falls in the home and these were mostly of elderly persons. Accidents caused by fire, hot liquids, etc, accounted for 90 deaths, of which 7 were of children under 5 years of age and 61 of persons aged 45 years and over. There were 27 deaths from accidental poisoning, 21 of which were of persons aged 25 years and over.

## UNCERTIFIED DEATHS

The number of cases in 1985 in which the cause of death was not certified by a medical practitioner was 10 which represents 0.03 per cent of the total deaths. In TABLE 23 uncertified deaths in 1985 are shown classified by county and age group, while the percentage of deaths uncertified in each county is also shown. Table XLII compares the percentages of deaths uncertified in each province for a number of years and it will be observed that a steady improvement in the position is taking place.

TABLE XLII

The proportion of deaths uncertified was highest in the age group 75 years and over; this age group accounted for three-fifths of the uncertified deaths.

## INQUESTS AND POST-MORTEMS

The number of deaths registered on certificates issued by coroners as the result of inquest and post-mortem examinations during 1985 was 3,514 compared with 3,364 in 1984.
