REPORT ON VITAL STATISTICS FOR THE YEAR 1978

This Report has been prepared by the Central Statistics Office for the Minister for Health in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952.

The statistics relate to the area in Ireland exclusive of Northern Ireland.

Births are classified according to the area of residence of the mother and deaths according to the area of residence of the deceased.

The number of births and deaths for each of the years 1943 to 1978 is exclusive of late registrations, and the number of deaths for each of the years 1940 to 1967 is exclusive of non-residents. From 1968 however the number of deaths included non-residents.

The main statistics contained in this Report have already been published, and the Report consists mainly of a breakdown and analysis of these.

Prior to 1970 births and deaths were classified according to year of registration. In order to comply with United Nations regulations it was decided to classify births and deaths by year of occurrence from 1970 onwards. Because of this change in the basis of classification, those births and deaths which occurred in 1969 but were registered in 1970 have been recorded neither in the 1969 nor in the 1970 Report on Vital Statistics. The number of births excluded on this account was 2,545 and the number of deaths, 2,279. Appendix tables to the 1971 Report show these births classified by age of mother at maternity and number of previous children, while deaths are classified by cause, sex and age group.

NOTE: More up to date information on Vital Statistics is published in the Quarterly Report on Births, Deaths and Marriages and on certain Infectious Diseases published about six months after the end of the quarter to which the data relates. In the Quarterly Report births and deaths are classified according to quarter of registration.

GENERAL SUMMARY

Marriages. - There were 21,184 marriages registered during the year 1978 compared with 20,016 in 1977. The marriage rate per 1,000 population was 6.39 compared with 6.12 in 1977.

Births. - The number of births occurring during 1978 was 70,299, 35,766 males and 34,533 females. The birth rate was 21.21 per 1,000 population compared with 21.06 per 1,000 population in 1977. The number of illegitimate births occurring during 1978 was 3,003 or 4.27 per cent of all births.

Deaths. - The number of deaths occurring during 1978 was 33,794, 18,442 males and 15,352 females and the death rate was 10.20 per 1,000 population. In 1977 deaths numbered 33,632 and the rate was 10.28

Of the deaths occurring in 1978, 32.4 per cent were stated to be due to ischaemic and other forms of heart disease, 17.9 per cent to other diseases of circulatory system, 18.4 per cent to cancer and 13.0 per cent to diseases of respiratory system.

There were 5,990 deaths from malignant neoplasms and neoplasms of lymphatic and haematopoietic tissues (excluding Hodgkin's disease and leukaemia and aleukaemia). This total is comparable with that for "cancer" in the 1949 and earlier Reports. The rate in 1978 was 1.81 per 1,000 population equivalent to that recorded in 1977.

During 1978 the number of deaths occurring of infants under one year was 1,046 compared with 1,069 in 1977 giving rates of 14.88 and 15.52 respectively per 1,000 live births.

The total number of deaths from accidents and other external causes in 1978 was 1,796 of which road vehicle accidents accounted for 635.

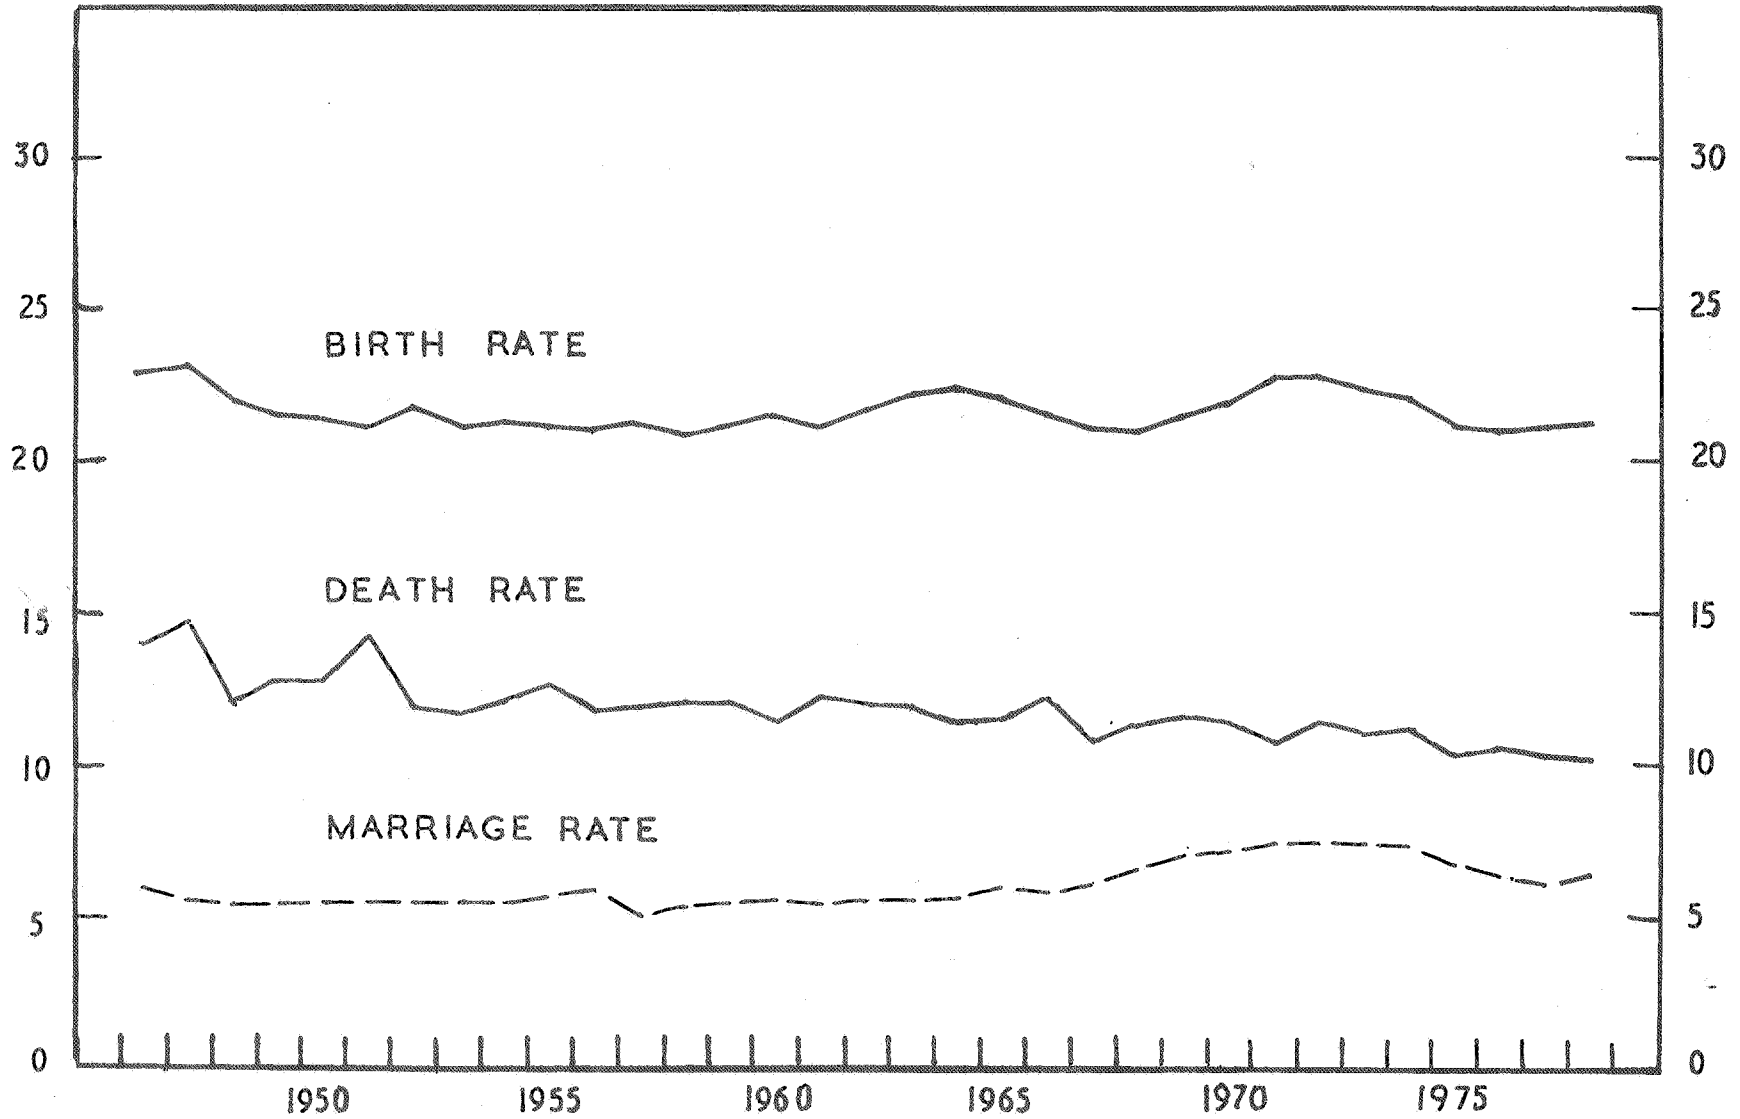

Marriage, birth and death rates per 1,000 population for the years 1945 to 1978 are illustrated in Diagram 1.

Issue of Authority for Registration. - Births and deaths which have not been registered within one year of their occurrence can be registered only on the authority of An tArd Chlaraitheoir. The number of such births registered on the authority of an tArd Chlaraitheoir in 1978 was 773 and the number of such deaths registered was 308. Throughout the tables in this Report these births and deaths have been excluded.

Population. - The estimated population in April 1978 was 3,314,000.

MARRIAGES

The number of marriages registered in 1978 was 21,184, an increase of 1,168 on the previous year; the rate was 6.4 per 1,000 population, 0.3 above that for 1977. TABLES 4 and 5 of this Report show the average numbers of marriages registered and marriage rates for ten-year periods since 1864 and by single years since 1971. The following table compares the marriage rate in Ireland in the years 1941 to 1978 with those in Northern Ireland, England and Wales and Scotland.

AGE AT MARRIAGE

Particulars of the ages of persons marrying in this country were obtained at the 1946 Census of Population. At that Census persons were asked to state their date of marriage and a special analysis was made of 14,338 marriages which had taken place in the preceding twelve months and in the case of which the husband and wife were enumerated on the same census schedule. Corresponding data have been available since 1957 from marriage registrations and the results obtained since have made possible an examination of the trends in age at marriage over the intervening period, which are summarised in the following table.

TABLE II

Whereas, in 1945-46, 59.0 per cent of the men marrying were aged 30 years and over, the proportion over this age had fallen to 18.5 per cent in 1978, the average age of men at marriage declining from 33.1 years in 1945-46 to 26.2 years in 1978. In 1945-46, 32.9 per cent of women marrying were aged 30 years and over compared with 10.4 per cent in 1978 while the average age at marriage declined from 28.0 years in 1945-46 to 24.0 in 1978. In TABLE 42 the marriages registered in 1978 are shown cross classified by age of groom and age of bride in single years while in TABLE 43 similar particulars are shown for marriages between bachelors and spinsters. From the latter table it may be calculated that the average ages of bachelors and spinsters marrying in 1978 were 26.3 and 24.1 respectively.

A comparison of first marriage rates per 1,000 single population in each age group in Ireland and in England and Wales in 1978 is made in Table III. The figures were obtained by dividing the number of single males marrying in each group by the total number of single males in that age group and similarly for females.

†16-19 years for England and Wales

For each sex the marriage rates in Ireland were considerably below those in England and Wales in the younger age groups. In the 20-24 year age group the England and Wales rate for both males and females was nearly one and a half times the Irish rate in 1978. The England and Wales rates were slightly higher, for both sexes, in the 35-44 year age groups and in the age groups above 45 the rates for England and Wales were significantly higher than the Irish rates.

MODE OF CELEBRATION

The number of marriages celebrated in accordance with the rites and ceremonies of the Catholic Church registered in 1978 amounted to 20,381 (equal to 96.2 per cent of the total) and other marriages numbered 803, of which 394 were according to the rites and ceremonies of the Church of Ireland, 65 in Presbyterian Churches, 17 in Methodist Churches, 2 according to Jewish rites, 3 in accordance with the rites and ceremonies of other religious denominations and 322 by civil contract in Registrar's Office.

The rate for Catholic marriages in 1978 was 6.47 per 1,000 of the Catholic population, an increase of 0.27 on the corresponding rate for 1977. The rate for all other marriages combined was 4.85 per 1,000 of the population other than Catholic, an increase of 0.35 on the 1977 rate.

† Average annual number of marriages and rates for decennial periods 1941-1960.

Marriages are classified according to form of ceremony, age of groom and age of bride in TABLES 44 and 45. For Catholic marriages the average age of the groom was 26.1 years compared with 29.5 years for other marriages (including Civil marriages). The average age of bride for Catholic marriages was 23.9 years and for other marriages, 26.5 years.

SOCIO-ECONOMIC GROUP

A classification which has been widely used in recent years in Census of Population statistics is that by Socio-economic Group. This classification is determined by a person's occupation or, in some cases, by a combination of occupation and employment status. The socio-economic group of a person not gainfully occupied is considered to be that of the gainfully occupied person on whom he or she is deemed to be dependent. The men and women married in 1978 were classified by socio-economic group on the basis of the information as to occupation given in the marriage register, and the results obtained are given in TABLES 46 to 48.

In TABLES 46 and 47 grooms and brides are classified by socio-economic group and age at marriage in each group. For both grooms and brides the average marriage age in 1978 was higher in the social group "Farmers, farmers' relatives assisting and farm managers" than in any other group and the lowest average was in the "Other manual workers" group.

TABLE 48 shows marriages registered in 1978 cross-classified by the social groups of groom and bride. Of the women marrying men in the "Skilled manual workers" group, in the case of whom occupation was stated, 55 per cent were in the "Intermediate and other non-manual workers" group, 19 per cent were other manual workers and 11 per cent were in the lower professional group, there being smaller percentages in each of the other groups. The distribution by socio-economic group of women marrying men in each of the remaining socio-economic groups may be considered in the same way. The table may also be examined by considering the socio-economic groups of the men marrying the women in each particular socio-economic group. Thus it will be seen that only 31 per cent of the women stated to be in the socio-economic group "Farmers, farmers' relatives assisting and farm managers" married men in socio-economic groups other than their own. A substantial number of women in the "Intermediate and other non-manual workers" groups married men in each of the other socio-economic groups. In the case of the majority of women in the "manual workers" groups the husbands belonged to the same groups.

AREA OF RESIDENCE

Four districts may be considered in relation to each marriage, namely that in which the marriage took place, the areas of residence of the bride and groom prior to marriage, and the intended future residence. In TABLE 41 figures for marriages according to place of occurrence are given for 1978. A comparison between the area of residence of the bride before the ceremony and the area in which the marriage took place is made in TABLE V.

In TABLES 49 and 50 marriages are shown classified by area of residence prior to marriage and age group of groom and bride. Confining attention to the marriages in the case of which the area of residence was within the State, it will be seen that the average age at marriage is lower in predominantly urban than in rural areas. Thus in the four county boroughs the average age of grooms was not over 26 years, whereas in the counties Clare, Cavan, Laois, Leitrim, Waterford county and Roscommon the average age was not less than 27 years. The average age of brides was not over 24 years in the four county boroughs. The lowest average age in the counties for brides was in Carlow and Tipperary S.R., 23.1 and the highest in Leitrim 25.3.

In TABLE 51 marriages are cross-classified by area of residence before marriage of groom and bride. As is to be expected, in the great majority of cases the groom and bride were from the same or neighbouring counties. A feature of the table is the large number of cases in which the address of the groom or bride or of both groom and bride were outside the State. Thus 635 of the men married in the State in 1978 were returned as residing in England, Wales or Scotland, 358 in Northern Ireland and 227 in other countries. The number of brides who were resident before marriage in England, Wales or Scotland was 386 the number from Northern Ireland was 194 and the number from other countries was 96. In 553 cases both the groom and bride were from outside the State. In the past it has been the practice to compute marriage rates for counties and county boroughs by relating the marriages registered in each area to the resident population of that area.

It will be observed that rates (a) and (b) differ on account of the fact that marriages of men whose area of residence was outside the country were included in the calculation of rate (a) and excluded from rate (b). In the case of the question on intended future permanent residence, the accuracy of many of the entries was not as high as for the other information supplied. There were 622 marriages registered in which no information on future residence was provided.

PERCENTAGE OF MARRIAGES WITH FUTURE INTENDED RESIDENCE
OUTSIDE THE STATE 1969 TO 1978.

1977	20,016	1,335	6.7
1978	21,184	1,408	6.6

As may be seen from Table VII the proportion of marriages with intended future residence outside the State shows a decline over the years. In the case of 727 marriages the future residence was in England and Wales, 299 in Northern Ireland, 44 in Scotland, 119 in other parts of Europe, 97 in the United States of America, 43 in Canada, 28 in Australia and New Zealand and 51 elsewhere. The age distributions and average ages of the grooms and brides going to the various countries are shown in TABLES 52 and 53 respectively. It will be seen that the average age of the men and women marrying and then going abroad was somewhat above the level of that for all marriages in the State. The marriages of persons going abroad are shown classified by socio-economic groups of groom and bride in TABLES 54 and 55 respectively. By comparing TABLES 46 and 54 it is possible to examine the proportions of men marrying in each socio-economic group who intended to reside outside the country, and it is found that this proportion varied considerably between the different groups. Table VIII contains the results obtained.

A classification of marriages of persons going abroad, by form of marriage ceremony, is made in TABLE 56. With the aid of this Table it may be calculated that in 1978 in the case of Catholic marriages the percentage with intended future residence outside the State was 6 per cent, equivalent to the level recorded in 1977. The corresponding figures for all other marriages were 13 per cent in 1978 and 19 per cent in 1977.

Finally, in TABLES 57 and 58 the marriages in the case of which the intended future residence was outside the State are shown classified by area of residence before marriage of groom and bride. The proportions which these marriages represent of the total when classified according to area of residence of groom are shown in Table IX.

BIRTHS

The number of births occurring during the year 1978 was 70,299, comprised of 35,766 males and 34,533 females. The corresponding figures for 1977 were 68,892, 35,518 and 33,374 respectively. The birth rate in 1978 was 21.2 per 1,000 population, compared with 21.1 in 1977.

CLASSIFICATION BY AGE AT MATERNITY, PARITY AND DURATION OF MARRIAGE

TABLE 38 shows the total number of births which occurred in 1978 classified by age of mother at maternity and number of previous liveborn children. The number of births in the case of which the mother's age was not stated was 262 or 0.4 per cent of the total. In 1977 the corresponding figure was 221 or 0.3 per cent of the total. The results contained in TABLE 38 are summarised in Table XI.

In preparing this table the procedure in the case of multiple births was to count each child as an individual birth. For instance if a fifth pregnancy produced twins the children would be classified as a fifth and sixth child in parity order.

Continuing the trend observed over the past decade there is in 1978 a shift towards the younger age groups in the distribution of births according to the age of mother at maternity. As may be calculated from Table XII, in 1978 mothers aged under 30 years at maternity accounted for 60.1 per cent of the births compared with 60.7 per cent in 1977, corresponding figures for England and Wales and Scotland for 1978 being 75.3 per cent and 77.9 per cent respectively, illustrating the difference between the countries.

The difference between this country and England and Wales and Scotland shown in Table XII is due to the fact that women in Ireland (a) marry at a later age and (b) have on average more children, as may be seen from Table XV. When attention is confined to legitimate first births, in order to eliminate the effect of factor (b), the difference is still pronounced in the under 20 age group and in the age groups above 30 as may be seen from Table XIII.

*Exclusive of Northern Ireland; rates are based on the 1978 estimated populations

In each age group the number of legitimate births per 1,000 married women was considerably higher in Ireland than in England and Wales. In the 15-19 year group the Irish rate in 1978 was 69 per cent above that in England and Wales, in the 20-24 year group 91 per cent greater, while the excess in the Irish rate rose steadily with increasing age. The number of illegitimate births per 1,000 single, widowed and divorced women was appreciably lower at all ages in Ireland than in England and Wales. On account of the much higher proportion of women married at the younger ages in England and Wales the fertility rates for all women combined were higher in England and Wales than in Ireland in the 15-19 year group but at the later ages the Irish rate was considerably higher.

The total number of illegitimate births was 3,003 being 124 more than in 1977. This was equivalent to an annual rate of 9.2 per 1,000 unmarried females aged 15 to 49 years and was 4.3 per cent of total births. The number of illegitimate births has shown an increase every year since 1959 when the lowest ever number was recorded.

The percentage distribution of births according to the number of previous children in 1977 and 1978 is shown in Table XV and a comparison made with the corresponding distributions in England and Wales and Scotland in 1978.

The difference between the years 1977 and 1978 in respect of the percentage distribution according to number of previous children was slight. The percentage of women with large families was considerably higher in Ireland than in England and Wales or Scotland. In Ireland in 1978, 8.6 per cent of the mothers had 5 or more previous children, the corresponding percentages being only 1.1 in England and Wales and 1.0 in Scotland.

MULTIPLE BIRTHS

The number of maternities in 1978 which resulted in multiple live births was 832 consisting of 816 sets of twins, 15 sets of triplets and one set of quadruplets. This is equivalent to a "twinning rate" (number of live twins per 1,000 maternities which resulted in live births) of 11.7. Table XVI summarises the number of multiple births and the "twinning rate" for the years 1969-1978.

DEATHS

The number of deaths occurring during the year 1978 was 33,794 of which 18,442 were those of males and 15,352 those of females equivalent to a rate of 10.20 deaths per 1,000 total population, compared with 10.28 in the previous year, and 10.55 in 1976.

In Table 9 are shown the average annual death rates, by age group, for decennial periods from 1864 to 1970 and the death rates for each year 1971 to 1978.

While the crude death rate per 1,000 population has shown a gradual downward trend since the beginning of the century, striking falls occurred in the death rates at the younger ages.

Table XVII compares the death rates in the years 1941-1978 with those in Northern Ireland, England and Wales and Scotland. The death rate in this country in 1978 was lower than in England and Wales and Scotland. Over the period covered in the table the decrease in this country has been greater than that in any of the other areas.

Attention should be drawn to the fact that these comparisons are based on crude death rates, which are to some extent affected by differences in the age-sex structures of the population in the different countries, while comparisons over a period of years are also affected by changes in the age-sex structures of the population.

COMPARISON BETWEEN COUNTIES

A difficulty arises when comparisons are made between the death rates in different regions of the country, due to the fact that the age distribution of the population varies considerably from one county to another. Thus, if a particular county contains a large proportion of elderly persons the crude death rate per 1,000 population will be relatively high even if the health conditions in that county are better than the general average. To overcome this difficulty standardised rates are prepared. For a particular county this is done by calculating the death rate in each age group of the population in that county and then multiplying the death rate in each age group by the population in the whole country in that age group and summing the resulting products. This sum is then divided by the total population in the country at all ages to decide the standardised rate for the county.

In certain areas the standardised death rates differ, appreciably from the crude rates, the extremes being in Dublin County (Remainder) which had a crude death rate of 4.64 and a standardised rate of 8.82 reflecting the very young age structure in Dublin County and in Leitrim where standardisation has the effect of lowering the death rate from 16.33 to 10.84 because of the comparatively old age structure in that county. The standardised rates in 1978 were lowest in Galway and highest in the County Carlow.

CAUSES OF DEATH

The tables in this Report showing causes of death are based on the Eighth Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death prepared by the World Health Organisation. The Eighth Revision was used for the first time in classifying deaths by causes in the 1968 Report. The Reports from 1958 to 1967 were based on the Seventh Revision.

In Table XIX the number of deaths in the various disease groups in the years prior to 1968 have been adjusted to conform to the structure of the groups under the 8th Revision of the International Classification of Diseases.

From Table XIX it can be seen that the major difference between the period 1955-57 and the year 1978 has been the drop in deaths from tuberculosis. The rate for 1978 was less than one quarter of the rate in 1955-57. In the case of other infective and parasitic diseases the rate dropped to less than one half of the 1955-57 rate. There were also significant falls in death rates from influenza and senility; in the case of senility the drop can be attributed to a decrease in the number of uncertified deaths and better certification of cause of death. Heart diseases remained the single biggest cause of death, followed by cancer, the rate for which showed an increase of 15 per cent since 1955-57.

* LATE FOETAL DEATHS NOT INCLUDED.

Of the deaths occurring in 1978, 77 per cent were due to four main causes, i.e. ischaemic and other forms of heart disease, malignant neoplasms, cerebrovascular disease and respiratory diseases. Diseases of the heart were responsible for the highest rates, 385 per 100,000 population for males and 276 per 100,000 females. Most of these deaths occurred at ages over 55. Malignant neoplasms were the next major cause, the rates for which were 204 and 171 for males and females respectively per 100,000 population. The rates for cerebrovascular disease were 114 and 146 respectively for males and females per 100,000 population; as in the case of heart diseases the greater number of these deaths occurred at ages over 55. The deaths from respiratory diseases were due mainly to pneumonia and bronchitis. Between the ages 5 to 34 years accidents were the greatest single cause.

Some of the principal causes of deaths are considered in greater detail in the following sections.

TUBERCULOSIS

In 1978 there were 206 deaths from tuberculosis, of which 124 were caused by the respiratory form and 82 by other forms of the disease. Between the period 1941-1950 and the year 1978 death rates from tuberculosis, particularly in the younger age groups, fell to a fraction of their former level. Of the 206 deaths in 1978, 90 per cent were in the age groups 45 and over.

The mortality from tuberculosis in the counties and county boroughs in 1978 is compared in Table 12 of this Report. The highest death rates from all forms per 1,000 population were in Cork County Borough (0.15) and Limerick County (0.13).

CANCER

Prior to 1950 under the Fifth Revision of the International List of causes of death, cancer deaths were those classified under 045-055. With the introduction of the Sixth Revision in 1950 the World Health Organisation recommended that total cancer deaths should be based upon Nos. 140-205 (Nos. 140-209 in Eighth Revision) of the International Statistical classification which now included Hodgkin's disease and leukaemia, but for comparability with the years prior to 1950 the total cancer figure less Hodgkin's disease and leukaemia should also be shown.

In 1978 there were 6,218 deaths from cancer (Nos. 140 to 209). Of this number, 48 deaths were caused by Hodgkin's disease and 180 by leukaemia and aleukaemia.

Table XXII shows the death rate from cancer in certain age groups in the years 1968 to 1978.

In the years under review the death rates from cancer showed little difference between males and females in the age groups under 34 years but between the ages 35 and 54 years the female rates were generally greater than those for males. In 1978 the male death rate for all ages was 19 per cent above that for females. The trend in the death rates from cancer since 1949 is shown in Diagram 3 but it should be noted that for reasons given earlier the figures plotted in this diagram exclude deaths from Hodgkin's disease, leukaemia and aleukaemia.

The crude death rate from cancer in 1978 varied from 2.56 per 1,000 population in Dun Laoghaire Borough to 1.01 in Dublin County (remainder). In certain areas, however, the standardised rates were considerably different from the crude rates and when comparing the relative seriousness of mortality in different counties it is, of course, the standardised rates which should be used. In the counties of the west and north-west standardisation had the effect of lowering the death rates considerably. The standardised rates varied from 2.45 per 1,000 population in Louth to 1.53 in Leitrim. The proportion of deaths not medically certified varies widely between the different areas (see Table 23), thus, the possibility that some cancer deaths in the areas with low medical certification may escape detection should be borne in mind in comparing the death rates between counties.

Full details of deaths due to cancer occurring in 1978, classified by site of the disease and age group are contained in TABLE 19. The number of deaths and death rates from cancer per 100,000 in each group for the main groups of sites are shown in Table XXV and it will be observed that there is in general a rapid rise in the death rate with increasing age. Deaths due to malignant neoplasms of the digestive system represented over one third of the total cancer deaths for each sex, the death rate for males being 12 per cent higher than that for females. The death rate from malignant neoplasms of the respiratory system was three times greater for males than for females.

CANCER OF THE BRONCHUS, TRACHEA AND LUNG

The number of deaths and death rates from cancer of the bronchus, trachea and lung in each year 1968 to 1978, classified by sex and age group, are shown in Table XXVI.

The main point that emerges from this table is that deaths from cancer of the bronchus, trachea and lung are much more common among males than among females. In 1968 the death rate in the case of males was 49.3 compared with 12.9 in the case of females. In 1978 the corresponding rates were 57.3 and 19.1 respectively. However, it should be noted that in the period under review deaths of women from cancer of the bronchus, trachea and lung have shown a remarkable increase.

The following table shows deaths and death rates from cancer of the bronchus, trachea and lung in Ireland and neighbouring countries during the years 1973 to 1978.

The most significant feature of this table is the low rate in Ireland in each year compared with those in the other areas. Throughout the period under review the yearly rates for England and Wales were almost double the Irish rates.

DISEASES OF THE CIRCULATORY SYSTEM

There were 17,012 deaths ascribed to diseases of the circulatory system (Nos. 390-458) in 1978 of which 9,117 were deaths of males and 7,895 of females. Details of these deaths, classified by cause and age may be obtained from TABLE 19 of this Report while the numbers assigned to each county and county borough are shown in TABLE 20. Deaths and death rates from certain groups of causes are given in Table XXIX.

The excess of male over female deaths in the case of diseases of the circulatory system is largely accounted for by the greater number of deaths of males from ischaemic heart disease (5,545 males compared with 3,520 females); in respect of the remaining groups of causes the difference between the male and female death rates is not nearly so pronounced.

RESPIRATORY DISEASES

Deaths from respiratory diseases (Nos. 460-519 in the International List) in 1978 numbered 4,396. These included 161 deaths caused by influenza, 2,011 by pneumonia, 1,052 by bronchitis and 1,172 due to other respiratory diseases.

PREGNANCY, CHILDBIRTH AND PUERPERIUM

The number of maternal deaths in 1978 was 12 compared with 8 in 1977. The death rate was 0.17 per thousand maternities. TABLE XXX shows the maternal deaths in 1978 classified by age of mother and cause and also deaths associated with pregnancy, childbirth and puerperium, but not classified as maternal, for the same year.

INFANT AND LATE FOETAL MORTALITY

The terms used in relation to infant and late foetal mortality are defined as follows:-

Infant death: Death at ages under 1 year of live born infant.

Early neo-natal death: Death at ages under 1 week of live born infant.

Neo-natal death: Death at ages under 4 weeks of live born infant.

Post-neo-natal death: Death between the ages of 4 weeks and 1 year of live born infant.

Late foetal death (stillbirth): Foetal death at or over 28 weeks gestation.

Perinatal deaths: Late foetal plus early neo-natal deaths.

Infant mortality rate: Infant deaths divided by total live births, multiplied by 1,000.

Neo-natal mortality rate: Neo-natal deaths divided by total live births, multiplied by 1,000.

Early neo-natal mortality rate: Early neo-natal deaths divided by total live births, multiplied by 1,000.

Late foetal mortality rate: Late foetal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

Perinatal mortality rate: Perinatal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

While statistics of infant mortality are obtained in the course of the usual procedure for registration of deaths, which has been in operation since the year 1863, particulars of late foetal mortality are obtained through a scheme of notification to the County Medical Officer of Health. The scheme of notifying late foetal deaths was introduced in 1957, but comparisons between different areas of the country showed marked differences in the coverage of the scheme in the early years. Consequently the number of late foetal deaths in the early years of the scheme is believed to be understated.

It will be seen from Table XXXII that the highest individual rate for infant mortality was in Longford and the lowest in Tipperary, N.R. The rate for perinatal mortality was highest in Westmeath and lowest in Mayo; while for late foetal mortality the highest rate was in Louth and the lowest in Roscommon.

INFANT MORTALITY

During the year 1978 there were 1,046 deaths of infants under one year, a decrease of 23 on 1977. The rate in 1978 of 14.9 per 1,000 live births is the lowest rate ever recorded.

	Other causes	355	16	6	7	25	54
	TOTAL	659	356	231	105	354	1,046

It will be seen that the relative importance of the various groups of causes differ appreciably between deaths at ages under one week and deaths at ages 4 weeks to one year. Of all deaths at ages under one week, 16 per cent were ascribed to immaturity, congenital anomalies accounted for 32 per cent, anoxic and hypoxic conditions not elsewhere specified (including asphyxia and atelectasis) 31 per cent and birth injuries 9 per cent.

At ages over 4 weeks congenital anomalies, respiratory diseases, and other infective and parasitic diseases were the main causes of death. Details of the 54 deaths included as other causes will be found in Table 19 where it will be noted that 17 of these were due to accidents.

LATE FOETAL DEATHS

The number of late foetal deaths notified in each year since the scheme was introduced is as follows:-

Year	Late Foetal Deaths
Average 1957-1966	1,215
1967	1,000
1968	934
1969	893

The causes of late foetal deaths notified in 1978 classified according to the Detailed International List are given in Table 28. The results are summarised in Table XXXVI.

More late foetal deaths resulted from congenital anomalies of foetus than from any other group, being 27 per cent of the total deaths. Placental and cord injuries was next at 25 per cent and haemolytic disease of the newborn at 2 per cent. Of the total deaths 22 per cent were classified as being due to ill defined or unknown causes.

As can be seen from Table XXXVII 645 late foetal deaths in 1978 occurred in hospitals; this is equivalent to 98 per cent of the total number of late foetal deaths.

ACCIDENTS, POISONING AND VIOLENCE

The number of deaths from external causes (Numbers E800-E999) occurring in 1978 was 1,796 of which 1,152 were males and 644 females. The corresponding figures for 1977 were 1,736, 1,068 and 668 respectively. In the Eighth Revision there is also a classification for deaths from external causes which are not specified as accidental or suicidal and which accounted for 94 deaths in 1978 (Table XL).

As can be seen from Table XL there is an excess of male mortality from accidents at all ages between 1 and 75 years. In these age groups the excess of male deaths may be largely attributed to the category Road Vehicle Accidents. At ages over 75 years, the excess of female deaths may be attributed to accidental falls, as can be seen from Table XLI. The vast majority of these falls occurred in the home (Table XLI).

610 deaths resulting from accidents in the home were recorded in 1978 compared with 649 in 1977. As will be seen from Table XLI 446 deaths in 1978 were attributed to accidental falls in the home and these were mostly of elderly persons. Accidents caused by fire, hot liquids, etc., accounted for 74 deaths, of which 14 were of children under 5 years of age and 45 of persons aged 45 years and over. Five deaths of children under one year old were due to obstruction and suffocation by food. There were 34 deaths from accidental poisoning, 28 of which were of persons aged 25 years and over.

UNCERTIFIED DEATHS

The number of cases in 1978 in which the cause of death was not certified by a medical practitioner was .85 which represents 0.3 per cent of the total deaths. In TABLE 23 uncertified deaths in 1978 are shown classified by county and age group, while the percentage of deaths uncertified in each county is also shown. The proportion of deaths uncertified is very high in the west, being highest in the year 1978 in County Mayo (1.5 per cent).

Table XLII compares the percentages of deaths uncertified in each province for a number of years, and it will be observed that a steady improvement in the position is taking place.

TABLE XLII

TOTAL	0.3	-	-	0.1	0.1	0.1	0.4
Actual number of deaths uncertified	85	-	-	2	6	13	64

The proportion of deaths uncertified was highest in the age group 75 years and over, this age group accounted for three-quarters of the uncertified deaths. In most age groups the provinces of Connacht and Ulster (part of) compare unfavourably with Leinster and Munster in respect of the percentage of deaths uncertified.

INQUEST AND POST-MORTEMS

The number of deaths registered on certificates issued by coroners as the result of inquest and post-mortem examinations during 1978 was 3,449 compared with 3,234 in 1977.
